## **MEMBERSHIP OF THE CHINOOK TECHNICAL COMMITTEE**

### **Canadian Members**

Dr. Rick McNicol, Co-Chair, CDFO  
Mr. Richard Bailey, CDFO  
Dr. Gayle Brown, CDFO  
Mr. Roger Dunlop, FNC  
Ms. Dawn Lewis, CDFO (unofficial member)  
Mr. Wilf Luedke, CDFO  
Mr. Chuck Parken, CDFO  
Ms. Teresa Ryan, FNC  
Mr. Julian Sturhahn, CDFO  
Mr. Joe Tadey, CDFO  
Dr. Arlene Tompkins, CDFO  
Mr. Ivan Winther, CDFO  
Mr. Howie Wright, FNC

### **United States Members**

Mr. C. Dell Simmons, Co-Chair, NMFS  
Mr. John Carlile, Co-Chair, ADF&G  
Dr. Dave Bernard, ADF&G  
Mr. Ryan Briscoe, ADF&G  
Mr. Ethan Clemons, ODFW  
Dr. John H. Clark, ADF&G  
Mr. Gary Freitag, SSRAA  
Mr. Ed Jones, ADF&G  
Dr. Robert Kope, NMFS  
Mr. Brian Lynch, ADF&G  
Ms. Marianne McClure, CRITFC  
Mr. Scott McPherson, ADF&G  
Dr. Gary Morishima, QIN  
Mr. James Packer, WDFW  
Mr. Rishi Sharma, CRITFC  
Dr. Ken Warheit, WDFW  
Mr. Alex Wertheimer, NMFS  
Mr. Henry Yuen, USFWS  
Dr. Marianna Alexandersdottir  
Dr. Yong-Woo Lee

## LIST OF APPENDICES

Appendix A. Landed Chinook catches by region and gear from 1975-2007.....	96
Appendix B. Escapements and terminal runs of PSC Chinook Technical Committee wild Chinook escapement indicator stocks, 1975-2007. ....	111
Appendix C. Relationship between exploitation rate indicator stocks, escapement indicator stocks, model stocks, and additional management action stocks identified in the PST annex. ....	121
Appendix D. ISBM indices. ....	127
Appendix E. Percent distribution of landed catch and total mortality among fisheries and escapement for exploitation rate indicator stocks by calendar year. ....	133
Appendix F. CWT (Cohort) release to age 2 survival indices (completed brood years only) and Chinook model-derived age 1 to age 2 survival indices (up to 2002) for exploitation rate indicator stocks. Indices are survival indices relative to base period. ....	198
Appendix G. Total mortality and landed catch exploitation rates <sup>1</sup> for exploitation rate indicator stocks <sup>2</sup> for complete broods up to 2002. ....	231
Appendix H. Model estimates of the stock composition of the AABM, and other troll and sport fisheries for 2007 and the average from 1985 to 2006. ....	249
Appendix I. Incidental mortality rates applied in the CTC model. Rates in original model were applied to all years. In the current model, rates in some fisheries vary in accordance to changes in management regulations. ....	256
Appendix J. Time series of abundance indices from 1979 to 2008 for SEAK, NBC, and WCVI AABM fisheries as estimated by CTC Chinook Model calibration CLB0807. ....	257
Appendix K. Abundance indices in total and by model stock for AABM fisheries, from Calibration #0807.....	258
Appendix L. Fishery exploitation rate indices by stock, age and fishery, based on CWT data, 1975-2006.....	265

## EXECUTIVE SUMMARY

The June 30, 1999, Pacific Salmon Treaty (PST) Annexes and Related Agreements (Agreement) substantially changed the objectives and structure of the Pacific Salmon Commission's (PSC) Chinook salmon fisheries and assessment of Chinook salmon stocks. The Agreement replaced the previous ceiling and pass-through fisheries with Aggregate Abundance Based Management (AABM) and Individual Stock Based Management (ISBM) fisheries. It also assigned the Chinook Technical Committee (CTC) with a number of tasks related to implementation of the Agreement (Appendix to Annex IV, Chapter 3).

This report summarizes the 2007 fishery catches by region, available estimates of incidental mortality by fishery and limited commentary on fishery catches where needed. Landed catch is reported in the appendices for each geographic area covered under the PST. An assessment of escapement for stocks with CTC accepted goals is included, and escapement data thru 2007 are provided for all escapement indicator stocks. This report also contains the principal results of the annual exploitation rate assessment of CWT data through 2006 and the final preseason Chinook model calibration for 2008 (CLB 0805). Results include the Abundance Indices (AIs) for the AABM fisheries and ISBM indices for each party (country).

### AABM ABUNDANCE INDICES AND ASSOCIATED CATCHES

The pre- and postseason AIs for the three AABM fisheries, Southeast Alaska All Gear (SEAK), Northern British Columbia Troll and Queen Charlotte Islands Sport (NBC), and West Coast Vancouver Island Troll and Outside Sport (WCVI) are presented in Table 1. The Agreement specifies that the AABM fisheries are to be managed through the use of the AIs. Each calibration provides the first postseason AIs for the previous year and the preseason AIs for the current year. Preseason AIs are used to set total allowable catch limits in the upcoming fishing season. Subsequently, postseason AIs (from the following year's calibration) are used to track catch overage and underage provisions. The first 2007 postseason AIs and the 2008 preseason AIs have now been finalized.

Table 1. Abundance Indices for 1999 to 2008 for the SEAK, NBC, and WCVI AABM fisheries.

Year	SEAK		NBC		WCVI	
	Preseason	Postseason	Preseason	Postseason	Preseason	Postseason
1999	1.15	1.12	1.12	0.97	0.60	0.50
2000	1.14	1.10	1.00	0.95	0.54	0.47
2001	1.14	1.29	1.02	1.22	0.66	0.68
2002	1.74	1.82	1.45	1.63	0.95	0.92
2003	1.79	2.17	1.48	1.90	0.85	1.10
2004	1.88	2.06	1.67	1.83	0.90	0.98
2005	2.05	1.90	1.69	1.65	0.88	0.84
2006	1.69	1.73	1.53	1.50	0.75	0.68
2007	1.60	1.34	1.35	1.10	0.67	0.57
2008	1.07		0.96		0.76	

In general, the AIs for 1999 through 2001 are low compared to AIs in the late 1980s and early 1990s but values increased substantially starting in 2002. The 2008 projected AI values have declined when compared to the high values for 2004 through 2007. The Agreement specifies an allowable catch for each AI for each fishery. The maximum allowable Treaty catch (total catch minus any hatchery add-on and exclusion catch) by fishery and year and the actual (observed) catches are shown in Table 2.

Table 2. Observed catches and postseason allowable catches for 1999 to 2007, and preseason allowable catches for 1999 to 2008, for AABM fisheries.

PST Treaty Allowable and Observed Catches									
Year	SEAK (T, N, S) <sup>1</sup>			NBC (T, S)			WCVI (T, S)		
	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch
1999	192,800	184,200	198,842	145,600	126,100	86,726	128,300	107,000	36,413
2000	189,900	178,500	186,493	130,000	123,500	31,900	115,500	86,200	101,438
2001	189,900	250,300	186,919	132,600	158,900	43,500	141,200	145,500	117,670
2002	356,500	371,900	357,133	192,700	237,800	150,137	203,200	196,800	165,036
2003	366,100	439,600	379,519	197,100	277,200	191,657	181,800	268,900	175,821
2004	383,500	418,300	417,019 421,666 <sup>2</sup>	243,600	267,000	241,508	192,500	209,600	216,624
2005	416,400	387,400	390,482	246,600	240,700	243,606	188,200	179,700	202,662
2006	346,800	354,500	357,678	223,200	200,000	215,985	160,400	145,500	146,883
2007	329,400	259,200	327,138	178,000	143,000	144,235	143,300	121,900	139,150
2008	170,000			124,800			162,600		

<sup>1</sup> Nomenclature is T for troll, N for net, and S for sport.

<sup>2</sup> The lower value resulted from subtracting a disputed terminal exclusion catch for the Stikine River in 2004. Catch accounting has since been defined in the Transboundary Agreement.

Table 3 shows the differences between the postseason allowable catches and the observed catches in AABM fisheries for 1999–2007, and the cumulative differential for those years. All three AABM fisheries have cumulative underages. In SEAK, observed catches have been below final allowable catches for three of the nine years; the cumulative differential is –1.5% or –1.3%. In NBC, observed catches have been below the final allowable catches in seven of the nine years; the cumulative differential is –24.0%. In WCVI, observed catches have been below allowable catches in four of the nine years; the cumulative differential is –10.9%.

Table 3. Deviations in numbers of Chinook salmon and percentages from catch targets derived from the first postseason AI (Table 2) for Pacific Salmon Treaty AABM fisheries in 1999 to 2007.

Year	SEAK		NBC		WCVI	
	Number of Fish	Percent Difference	Number of Fish	Percent Difference	Number of Fish	Percent Difference
1999	+14,642	+7.9%	-39,374	-31.2%	-70,587	-66.0%
2000	+7,993	+4.5%	-91,600	-74.2%	+15,238	+17.7%
2001	-63,381	-25.3%	-115,400	-72.6%	-27,830	-19.1%
2002	-14,767	-4.0%	-87,663	-36.9%	-31,764	-16.1%
2003	-60,081	-13.7%	-85,543	-30.9%	-93,079	-34.6%
2004	-1,281 +3,366	-0.3% +0.8%	-25,492	-9.5%	+7,024	+3.4%
2005	+3,082	+0.8%	+2,906	+1.2%	+22,962	+12.8%
2006	+3,178	+0.9%	+15,985	+8.0%	+1,383	+1.0%
2007	+67,938	+26.2%	+1,235	+0.9%	+17,250	+14.2%
Cum.	-42,678 -38,031 <sup>1</sup>	-1.5% -1.3% <sup>1</sup>	-424,946	-24.0%	-159,403	-10.9%

<sup>1</sup> The lower value resulted from subtracting a disputed terminal exclusion catch for the Stikine River in 2004. Catch accounting has since been defined in the Transboundary Agreement.

## ISBM INDICES

For ISBM fisheries, the Agreement specified that Canada and the United States would reduce base period exploitation rates on specified stocks by 36.5% and 40%, equivalent to ISBM indices of 63.5% and 60% percent, respectively. This requirement is contained in Chapter 3 section 4(d) of the treaty and is referred to as the 'general obligation' and does not apply to stock groups that achieve their CTC agreed escapement goals. Estimated ISBM fishery indices are shown in Table 4 for Canadian fisheries and Table 5 for United States (U.S.) fisheries. Both tables present CWT-based indices for 2006, and Chinook model-based indices for 2008. The agreement specifies that the ISBM indices be forecasted preseason and evaluated postseason for each escapement indicator stock listed in Attachments I to V of the Chinook Chapter.

### CWT-based Indices in 2006

All of the six Canadian ISBM indices from the Coded Wire Tag (CWT)-based estimates for 2006 show that exploitation rates were reduced more than required for all stocks or stock groups for which the indices could be calculated. Four of the 16 U.S. ISBM indices for the CWT based estimates for 2006 were reduced more than required. Of the 10 U.S. CWT-based ISBM indices that exceeded 0.60, ten (Upriver Brights, Quillayute, Queets, Hoh, Lewis, Mid-Columbia Summers, Nehalem, Siletz, Siuslaw and Cowichan) have agreed escapement goals and all but the Cowichan stock exceeded their goals in 2006.

Table 4. Canadian 2006 ISBM indices based on CWT and the 2008 indices predicted from the PSC Chinook Model.

Stock Group	Escapement Indicator Stock	Canadian ISBM Indices	
		CWT Indices for 2006	Model Indices for 2008
Lower Strait of Georgia	Cowichan Nanaimo	0.191 <sup>4</sup> NA <sup>1,5</sup>	0.315 <sup>6</sup>

<sup>1</sup> Not available (NA) because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc).

<sup>2</sup> Stock or stock group with a CTC agreed escapement goal.

<sup>3</sup> Stock groups listed in Annex 4, Chapter 3, Attachment V.

<sup>4</sup> An inconsistency was discovered between the approaches used to calculate the model-based and CWT-based indices. The former included harvest rates for terminal sport while the latter did not. Terminal sport harvest rates are now included in the calculation of both indices. Further review is yet required to determine whether the base period terminal sport harvest rates obtained from analyses of Big Qualicum CWT recoveries adequately represent impacts that would have occurred on Cowichan Chinook.

<sup>5</sup> Several problems have been identified in the approach previously used to calculate the CWT-based indices for Nanaimo Chinook. Until these problems are resolved, indices for this stock will not be reported.

<sup>6</sup> Although model-based indices were previously calculated separately for Cowichan and Nanaimo, these did not adequately represent impacts on either LGS stock because the model-based data represent an aggregate of the two stocks and methods do not currently exist to correctly disaggregate these data for calculation of the ISBM values. Until such methods are developed, a single index value only will be reported representing the aggregate.

<sup>7</sup> The terminal sport harvest rates for Chilliwack Hatchery Chinook, the indicator stock, were removed from the calculation for the Harrison River naturals because sport harvest has been essentially zero on the natural population.

<sup>8</sup> For Canadian ISBM fisheries, the same distribution and Index value are used for Lake Washington and Green R.

<sup>9</sup> ISBM indices for WCVI naturals are based on information from Robertson Cr. hatchery stock, including terminal harvest rates. Prior to this report, harvest rates for terminal net and sport fisheries were treated as equal between the naturals and the hatchery indicator. However, this ignored the fact that since 1999, there has been no terminal net harvest of the vast majority of natural stocks on the WCVI. Consequently, indices for WCVI naturals were adjusted to reflect this zero terminal net harvest rate. In addition, some inconsistencies were noted in the treatment of

terminal harvest rates between the model and CWT indices for this stock group. These inconsistencies were eliminated.

### Predicted ISBM Indices for 2008

Five of the 19 ISBM indices for Canada, based on outputs from calibration 0807, are predicted to exceed the allowable value of 0.635 for Canadian ISBM fisheries in 2008 (Table 4). None of the Puget Sound Natural Summer/Fall stocks (Skagit, Stillaguamish, Snohomish, Lake Washington and Green River) have CTC agreed escapement goals. Eight of the 22 U.S. ISBM indices based on calibration 0807 are predicted to be above the allowable limit of 0.60 for U.S. ISBM fisheries in 2008 (Table 5). All eight have CTC agreed escapement goals: Queets, Hoh, Quillayute, Upriver Brights, Mid-Columbia Summers, Nehalem, Siletz, and Siuslaw.

Table 5. U.S. 2006 ISBM indices based on CWT and the 2008 indices predicted from the PSC Chinook Model.

Stock Group	Escapement Indicator Stock	U.S. ISBM Indices	
		CWT Indices for 2006	Model Indices for 2008

<sup>1</sup> Not available (NA) because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc).

<sup>2</sup> Stock with a CTC agreed escapement goal.

<sup>3</sup> Stock groups listed in Annex 4, Chapter 3, Attachment IV.

<sup>4</sup> NC means that the current model assumes the stock is not caught in U.S. ISBM fisheries.

## ESCAPEMENTS THROUGH 2007

The escapements of 50 naturally spawning escapement indicator stocks/stock aggregates are reviewed annually. Biologically-based escapement goals have been accepted by the CTC for 24 of the 50 escapement indicator stocks/stock aggregates. For 12 of these, the agency escapement goal is defined as a range; for the remaining 12, the escapement goal is the point estimate of  $S_{MSY}$  (escapement producing maximum sustained yield). In 2007, escapements were within the goal range for seven stocks, above the range or  $S_{MSY}$  point estimate for four stocks, and below the goal for thirteen stocks. Data for stocks without accepted goals are presented to illustrate trends in escapement. The CTC will continue to review escapement goals, as they are provided to the committee.

## 1 CHINOOK CATCH

The June 30, 1999, Pacific Salmon Treaty (PST) Annexes and Related Agreements (Agreement) substantially changed the objectives and structure of the Pacific Salmon Commission's (PSC) Chinook salmon fisheries. The Agreement eliminated the previous ceiling and pass-through fisheries and replaced them with Aggregate Abundance Based Management (AABM) and Individual Stock Based Management (ISBM) fisheries. Chinook catches for the AABM fisheries in 2006 are summarized in Tables 1.1-1.4. Historical catches for PSC Chinook fisheries are given in Appendices A.1-A.14.

Starting with the report CTC (2004a), the Chinook Technical Committee included estimates of incidental mortalities associated with landed catch for each component of each AABM fishery and most ISBM fisheries (CTC 2004b). Limited commentary on both AABM and ISBM fisheries is also provided.

### 1.1 REVIEW OF AABM FISHERIES

AABM fisheries for Chinook are managed to achieve a target catch corresponding to a target exploitation rate index and each year's abundance index (AI) in Table 1 of the Agreement. AABM fisheries are mixed stock salmon fisheries that intercept and harvest migratory Chinook from many stocks. The AABM fisheries (Annex IV, Chapter 3, paragraph 2) are:

- 1) Southeast Alaska (SEAK) All Gear,
- 2) Northern BC (NBC) Troll and Queen Charlotte Islands (QCI) sport, and
- 3) West Coast Vancouver Island (WCVI) Troll and Outside Sport.

Catches for these three fisheries are reported in Table 1.1.

Table 1.1. Annual catches and hatchery add-ons for the AABM fisheries, in thousands of Chinook salmon. The Treaty catches do not include the add-on or exclusions (see Section 1.1.1 and Appendix A.1). Notation is T for Troll, N for Net and S for sport.

Year	SEAK (T, N, S)			NBC (T), QCI (S)		WCVI (T, S)	
	Treaty Catch		Hatchery Add-on	Treaty Catch		Treaty Catch	
	Limit <sup>1</sup>	Observed		Limit <sup>1</sup>	Observed	Limit <sup>1</sup>	Observed
1999	184.2	198.8	47.7	126.1	86.7	107.0	36.4
2000	178.5	186.5	74.3	123.5	31.9	86.2	101.4
2001	250.3	186.9	77.3	158.9	43.5	145.5	117.7
2002	371.9	357.1	68.2	237.8	150.1	196.8	165.0
2003	439.6	379.5	57.5	197.1	191.7	268.9	175.8
2004	418.3	417.0/421.7 <sup>2</sup>	76.0	267.0	241.5	209.6	216.6
2005	387.4	390.5	65.8	240.7	243.6	179.7	202.7
2006	354.5	357.7	49.4	200.0	216.0	145.5	146.9
2007	329.4	327.1	70.2	178.0	144.2	143.3	139.2
2008	170.0			124.8		162.6	

<sup>1</sup> Allowable treaty catches correspond to the postseason AIs for 1999-2007.

<sup>2</sup> The value on the left does not account for a terminal exclusion for the Stikine River, whereas the value on the right includes such terminal exclusion catch.

### 1.1.1 Southeast Alaska Fisheries

The SEAK Chinook fishery has been managed to achieve the annual all gear PSC allowable catch through a plan established by the Alaska Board of Fisheries. Once the all gear allowable catch is determined from the preseason AI each spring, this plan establishes gear quotas for the troll, net, and sport fisheries. The allocation plan reserves 4.3% of the total PSC catch for purse seine, 2.9% for drift gillnet and 1,000 fish for combined set gillnet fisheries. After the net quotas are subtracted, 80% of the remainder is reserved for troll gear and 20% for the sport fishery. The sport fishery is managed in-season with bag-limits and other constraints. Regulatory history and maps for each SEAK fishery are detailed in CTC (2004b).

In addition, the SEAK fisheries were managed for:

- 1) An Alaskan hatchery add-on estimated from CWT sampling, minus 5,000 base-period Alaska hatchery harvest. As a risk adjustment to account for sampling error, the lower bound of the 90% confidence interval is used as the estimate of Alaska hatchery harvest.
- 2) An exclusion of Situk stock catch in District 108, and exclusions of wild Chinook originating from the Taku and Stikine Rivers.
- 3) Compliance with provisions established by the National Marine Fisheries Service in accordance with the U.S. Endangered Species Act (ESA).
- 4) Consistency with the provisions of the PST as required by the Salmon Fishery Management Plan of the North Pacific Fishery Management Council that was established by the U.S. Magnuson-Stevens Act.

The total harvest in SEAK in 2007 was lower than harvests from 2002 to 2006. The pre-season AI of 1.60 allowed an initial all-gear catch of 329,400 fish per the Agreement. The all gear harvest was 406,881, comprised of a treaty catch of 327,138, an add-on of 70,187, and excluded catch of 9,556 Chinook salmon. A breakdown by gear for total catch, Alaskan hatchery contributions and terminal exclusions is detailed in Table 1.2. Historical harvests for 1975-2007 for SEAK are in Appendix A.1.

Table 1.2. Harvest of Chinook salmon in SEAK by gear type in 2007.

<b>Gear</b>	<b>Total Harvest</b>	<b>Alaskan Hatchery Harvest</b>	<b>Alaskan Hatchery Add-on</b>	<b>Catch Exclusion<sup>1</sup></b>	<b>Treaty Catch</b>
<b>Troll</b>					
Winter	46,872	4,719	4,045	0	42,827
Spring	49,789	19,509	16,902	1,412	31,475
Summer	171,488	6,314	5,412	0	166,076
Troll subtotal	268,149	30,542	26,359	1,412	240,377
<b>Sport</b>					
	82,848	22,822	20,539	458	61,851
<b>Net</b>					
Set Net	1,549	0	0	0	1,549
Driftnet	27,068	14,044	12,561	7,686	6,821
Seine	27,267	11,013	10,728	0	16,539
Net subtotal	55,884	25,058	23,289	7,686	24,910
<b>Total</b>	<b>406,881</b>	<b>78,421</b>	<b>70,187</b>	<b>9,556</b>	<b>327,138</b>

<sup>1</sup> Exclusion catch claimed in 2007 is for the harvest sharing arrangement on the Taku and Stikine Rivers. There was no catch exclusion claimed on the Situk in 2007 as the catch did not reach the base level.

## 1.1.2 British Columbia Fisheries

Under the 1999 PST Agreement, the AABM fishery was defined to include NBC troll catch in statistical areas 1-5 and QCI sport catch in statistical areas 1 and 2. The total AABM catch in 2007 was 144,235. The WCVI AABM fishery includes the WCVI troll and the outside WCVI Chinook sport fishery (defined below). The total AABM landed catch in 2007 was 139,150 (Table 1.3).

### 1.1.2.1 NBC Troll Fishery Harvest

The NBC troll fishery landed 83,235 Chinook salmon in 2007. The fishery was opened for Chinook fishing from June 15 to August 17, 2007. The majority of the 2007 fishery was conducted under a demonstration fishery to examine the application of individual transferable quotas (ITQ's) in the troll fishery. A total of 82,383 Chinook were caught under the quota system. A traditional

derby style fishery accounted for 852 Chinook. There were 144 licensed vessels that participated in the ITQ fishery and 2 vessels that participated in the derby fishery. No NBC Troll test fisheries were conducted in 2007.

Prior to the 2006 season troll vessel operators were permitted to reselect fishing areas coast wide. The NBC troll fishery in Area F received an additional 80 vessels bringing the total number of licences in the area to 246. This fleet was in place for the duration of the 2007 fishery. After the fishery there was another area selection and the current Area F fleet increased to 284 licensed vessels (subject to appeals). The continued influx of vessels has been attributed to reduced fishing opportunities in southern areas and the introduction of ITQs.

The size limit for Chinook salmon caught in the NBC troll fishery was 67 cm. Barbless hooks and revival boxes were mandatory in the troll fishery. A ribbon boundary around Langara Island and from Skonun Point to Cape Knox on Graham Island excluded the commercial troll fishery from areas within one nautical mile of the shore for the full duration of the Chinook fishery.

Table 1.3. Summary of landed catch by gear for Canadian AABM fisheries in 2007.

<b>AABM Fishery</b>	<b>Troll</b>	<b>Sport</b>	<b>Total</b>
NBC	83,235	61,000	144,235
WCVI	92,921	46,229	139,150

#### ***1.1.2.2 NBC and CBC Sport Fishery Harvest***

Tidal recreational fisheries in NBC and CBC (marine statistical Areas 1-11) are managed under one set of regulations (45 cm minimum size limit; two Chinook per day and four in possession; annual bag limit of 30). During the past decade, recreational fisheries in the marine areas of NBC and CBC have expanded substantially. Management of these marine recreational fisheries now recognizes two basic regions: QCI, and the coastal mainland. Only the QCI recreational catch is included in the AABM totals. Since 1995, catches in the QCI recreational fisheries have been estimated by creel surveys, lodge logbook programs and independent observations by CDFO staff. Catch for this fishery in 2007 was 61,000 Chinook salmon. Thus, the total NBC AABM catch (troll plus sport) between October 1, 2006 and September 30, 2007 was 144,235 Chinook salmon (Table 1.3).

#### ***1.1.2.3 West Coast Vancouver Island AABM***

Under the 1999 PST Agreement, the WCVI AABM fishery includes the WCVI troll and the outside WCVI Chinook sport fishery (defined below). The total AABM landed catch (First Nations, troll, and outside tidal sport) in 2007 was 139,150 Chinook (Table 1.3).

##### ***1.1.2.3.1 WCVI Troll Fishery Harvest***

The AABM troll catch includes the commercial Area G troll catch and First Nations troll caught Chinook in Statistical Areas 21, 23-27, and 121-127. In the 2007 season (October 1, 2006-September 30, 2007), the WCVI troll fishing opportunities were consistent with a CDFO commitment to evaluate winter fisheries as a means to improve the economic base for the fleet and local communities while increasing flexibility in harvest opportunities and reducing the harvest rates on stocks encountered in summer fisheries (Table 1.4). Troll fishery openings were shaped by conservation concerns for early spring-run Fraser River, WCVI and Strait of Georgia (SG) Chinook and upper Fraser River and Thompson River coho.

To protect early spring-run Fraser and SG Chinook, SWVI areas 123-124 were closed from mid-March to mid-April. To protect Upper Fraser and Thomson River coho, coho non-retention remained in effect for the spring/summer period, coho encounter rates were monitored, and commercial fisheries were closed from late June until mid September. To protect WCVI Chinook, summer fisheries were very limited, and September fisheries were conducted 5 nautical miles seaward of the surfline. To protect SG Chinook, harvest levels were reduced during the spring period when recent impacts were highest (determined through a review of Cowichan CWT recoveries): the April catch was reduced from 57,063 in 2005 and 20,561 in 2006 to 5,223 in 2007. May catch was reduced from 26,655 in 2005 to 7,078 in 2006, but increased to 23,464 in 2007. This measure also provides some benefits to spring run US Chinook stocks when the mature run is abundant on the WCVI. Statistical Area 121 (the southern bank area) remained closed in 2007. Selective fishing practices were mandatory, including single barbless hooks and "revival tanks" for resuscitating coho salmon prior to release. Size limits for commercial troll remained unchanged in most periods of 2006/2007 at 55 cm (fork length). The size limit for the September fishery was 62 cm (fork length). The majority of catch from November through March came from Area 126. The majority of the catch in September came from Area 123.

Table 1.4. Fishing periods and Chinook harvested and released during the 2007 accounting year in the WCVI commercial troll fishery.

Fishing Period	Areas Open	Area Predominately Fished	Landed Catch	Sub-legal releases
Oct 1-03/06	123-127	123	16,026	1,807
Nov 8-24/06	123-127	123	980	149
Nov 25-30/06	23/123-127	126	210	54
Dec 1-31/06	23/123-27/127	126	770	162
Jan 1-31/07	23/123-27/127	126	5,440	771
Feb 1-28/07	23/123-27/127	126	2,587	449
Mar 1-6/07	23/123-27/127	126	528	59
Mar 17-31/07	23-27, 125-127	126	1,728	323
Apr 7-15/07	23-27, 125-127	126	440	65
Apr 16-30/07	23/123-27/127	123	4,783	217
May 1-31/07	23/123-27/127	123	23,464	1567
Jun 1-10/07	23/123-27/127	123	13,503	530
Jun 18-20/07	23/123-27/127	123/125	11,480	712
Sep 18-20/07	123-127	123	5,450	1876
Sep 21-28/07	125-127	126	532	69
<b>TOTAL</b>			<b>87,921</b>	<b>8,810</b>

Note: WCVI troll fisheries were closed late June to early-September to avoid encounters of Upper Fraser and Thompson River coho and WCVI Chinook.

The catches for 2007 Area G troll fisheries between October 1, 2006 and September 30, 2007 were 87,921 Chinook (Table 1.4). An estimated 5,000 Chinook were caught in WCVI First Nations troll fisheries in 2007. Therefore, the total WCVI AABM troll catch for 2007 was 92,921 with 8,810 sublegal Chinook releases (not including releases from the WCVI First Nations troll fisheries, which are currently unknown).

#### 1.1.2.3.2 WCVI Recreational Fishery Harvest

The AABM recreational fishery includes all catch in northwest WCVI (Areas 25–27, 125–127; Figure 1) between October 16 through June 30, and the catch outside one NM offshore from July 1 through October 15, plus all the catch in southwest WCVI (Areas 21–24) between October 16 through July 31, and outside one NM offshore from August 1 to October 15. Catch inside the surf line and outside the AABM periods specified above is included in ISBM fishery catch.

The outer WCVI sport fishery occurs primarily in the Barkley Sound, outer Clayoquot Sound, and Nootka Sound areas. The majority of fishing effort occurs from mid-July to September in NWVI and August through mid-September in the SWVI. Creel surveys are generally conducted from late May or early June to September 30. For the outside sport fishery the Chinook daily bag limit was two Chinook greater than 45 cm. Barbless hooks were mandatory.

Recreational effort in the AABM portion of the WCVI fishery was estimated at 26,306 boat trips in 2007. The 2007 WCVI AABM sport catch estimate during the creel period was 46,229 Chinook (Table 1.5). Catch rates were determined from interviews collected at 17 landing sites from June 1 to September 30. No creel surveys occurred between the months of October and May, as effort is relatively low during this period.

Table 1.5. Outer WCVI AABM sport fishery catches of Chinook by statistical area in 2007 representing catch during the creel survey periods only.

Statistical areas						
21/121	23/123	24/124	25/125	26/126	27/127	Total
6,159	27,731	4,522	2,143	1,324	4,351	46,229

## 1.2 ESTIMATES OF INCIDENTAL MORTALITIES IN AABM FISHERIES

### 1.2.1 SEAK Fisheries

Estimates of incidental mortality (IM) in SEAK fisheries are shown in Table 1.6. Estimates were available for all SEAK fisheries through 2007, except for the sport fishery for which 2007 data have not yet been tabulated. The IM for the troll and sport fisheries were estimated from direct fishery observation programs. Estimates for the net fishery included IM for both seine and gillnet fisheries. For the seine fishery, estimates were based on regressions between landed catch in traditional fisheries and IM, from the 1985–1987 purse seine studies (CTC 2004c). For the gillnet fishery, drop-off mortality was estimated as a percentage of the landed catch using the regional-specific drop-off rate for SEAK (CTC 2004c).

Table 1.6. Estimated encounters and incidental mortality in SEAK troll, net and sport fisheries for 2003-2007. Mortality estimates of fish released in troll and sport fisheries include drop-off mortality. In the net fishery, 21"-28" fish from both retention and non-retention periods are included in the CNR numbers.

Panel A - Troll and Sport Fisheries								
Year		Troll				Sport		
		Retention Fishery		CNR Fishery		Retention	Releases	
		Legal				Legal		
		Drop-off	Sublegal	Legal	Sublegal	Drop-off	Legal	Sublegal
2003	Encounters	NA <sup>1</sup>	54,987	34,262	19,703	NA <sup>1</sup>	25,518	57,006
2003	IM	2,646	14,462	7,503	5,182	2,497	4,057	9,064
2004	Encounters	NA <sup>1</sup>	26,175	71,834	34,980	NA <sup>1</sup>	43,148	63,991
2004	IM	2,837	6,884	15,732	9,200	3,150	6,861	10,175

<sup>1</sup> Drop-off mortality is computed from landed catch times a percentage that incorporates a gear-specific encounter ratio and release mortality rate.

## 1.2.2 British Columbia Fisheries

### 1.2.2.1 NBC Fisheries

Table 1.7 summarizes encounter and IM estimates for the NBC AABM fisheries from 2002 to 2007 by size class during retention and Chinook Non-retention (CNR) fishing periods. Encounters for the NBC troll fishery are based on phone-in hails. Encounters for the QCI sport

fishery are based on creel survey and logbook programs. The table presents IM estimates using size specific rates from the CTC (1997). The estimated total mortality of Chinook salmon in the NBC AABM fisheries in 2007 was 159,321 nominal fish, including 144,235 fish in the landed catch and 15,086 fish from IM (Table 1.7).

Table 1.7. Estimated encounters and incidental mortalities (nominal fish) in NBC AABM troll and sport fisheries for 2002-2007. Mortality estimates of fish released in troll and sport fisheries include drop-off mortality.

Year		Troll				Sport		Total Incidental Mortalities	
		Retention Fishery		CNR Fishery		Retention	Releases <sup>2</sup>		
		Legal & Sublegal Drop-off	Sublegal releases	Legal	Sublegal	Legal & Sublegal Drop-off	Legal	Legal	Sublegal

	IM	2,692	2,467	314	24	4,451	6,236	13,693	2,491
2007	Encounters	NA <sup>1</sup>	9,315	1,896	212	NA <sup>1</sup>	35,527		
	IM	1,415	2,208	383	50	4,209	6,821	12,828	2,258

<sup>1</sup> Drop-off mortality is computed from landed catch times a percentage that incorporates a gear-specific encounter ratio and release mortality rate.

<sup>2</sup> Releases are reported as 'mixed' sizes. However, since >90% of such releases are legal-sized, all reported releases were considered to be legal-sized for the purpose of estimating incidental mortality.

#### 1.2.2.2 WCVI Fishery

The estimated total mortality of Chinook salmon in the WCVI AABM fisheries in 2007 was 150,045 nominal fish, including 139,130 fish in the landed catch and 10,915 fish from IM (Table 1.8). The estimated IM included 5,882 legal and 5,033 sublegal fish in nominal numbers of fish. The estimates for the commercial troll fisheries in 2007 are based on landed catch multiplied by rates of encounter from previous years. Table 1.8 summarizes encounter and IM estimates for these fisheries by size class during retention. In 2007 there were no CNR fishing periods in the AABM fishery.

Table 1.8. Estimated encounters and incidental mortalities (nominal fish) in WCVI troll and sport AABM fisheries for 2004-2007. Mortality estimates of fish released in troll and sport fisheries include drop-off mortality.

		Troll				Sport			Total Incidental Mortalities

	IM	1,545	2,029	0	0	3,190	1,147	3,004	5,882	5,033

<sup>1</sup> Legal drop-off mortality is computed from landed catch, incorporating both an encounter ratio and a mortality rate.

<sup>2</sup> Sublegal dropoffs are included with sublegal incidental release mortalities

### 1.3 REVIEW OF ISBM FISHERIES

#### 1.3.1 Canadian ISBM Fisheries

ISBM fisheries include all fisheries that harvest or release Chinook salmon in British Columbia under PST jurisdiction outside areas governed by AABM fisheries. In 2007, 228,411 Chinook were harvested in Canadian ISBM fisheries in British Columbia and Canadian sections of the Alsek, Taku and Stikine Transboundary rivers. Total estimated IM in the Canadian ISBM fisheries in 2007 was 29,634 legal and 9,045 sublegal sized Chinook. The distribution of the landed catches and estimated incidental mortalities in Canadian ISBM fisheries are presented in Table 1.9. Historical catches in Canadian fisheries are in Appendixes A2 through A7.

Table 1.9. Landed catch and incidental mortalities in Canadian ISBM fisheries for 2007.

<sup>1</sup> Includes drop-off and release mortalities in both retention and Chinook non-retention fisheries

<sup>2</sup> In Chinook non-retention fisheries, all releases were assumed

to be legal size as the sizes were unknown. If no release information is available, IM represents dropoff mortality only

<sup>3</sup> Minimum size limits for sport catch were 62 cm in Georgia Strait and part of Juan de Fuca and 45 cm elsewhere. Little to no CN releases under 33cm

<sup>4</sup> Includes areas 1-5

<sup>5</sup> Includes areas 6-10

### **1.3.2 Southern U.S. Fisheries Harvest**

Southern U.S. fisheries of interest to the PSC, generally those north of Cape Falcon, Oregon, are managed in accordance with legal obligations stemming from treaties between Indian tribes and the United States. In 1974, *U.S. v Washington* set forth sharing obligations to meet Treaty fishing rights in western Washington. Treaty rights of Columbia River tribes were defined by *U.S. v Oregon*, and the Columbia River Fisheries Management Plan was implemented in 1977. In reporting these fisheries, fishermen are termed "treaty" if they are fishing under the Native Treaty fishing rights and "non treaty" otherwise. As specified in the 1999 agreement, all southern U.S. fisheries are ISBM fisheries. Historical catches in these fisheries may be found in Appendices A.8 through A.14.

#### ***1.3.2.1 Strait of Juan de Fuca and the San Juan Islands***

The preliminary estimate of the 2007 Chinook catch in Strait of Juan de Fuca tribal net fisheries directed at sockeye salmon is 938. An additional 18 Chinook were taken during the coho management period. The preliminary estimate of the 2007 Chinook catch in the San Juan Islands tribal net fishery directed at sockeye salmon is 5,088. Non-treaty landings totaled about 144 Chinook. The preliminary estimate of the 2007 Strait of Juan de Fuca treaty troll fishery is 4,329 Chinook through December. The catch estimate does not include catches from Area 4B during the May-September PFMC management period. These are included in the North of Cape Falcon troll summary. Historic catch estimates are provided in Appendices A.8 and A.9 for the Strait of Juan de Fuca and San Juan areas respectively.

#### ***1.3.2.2 Puget Sound***

The preliminary estimate of the 2007 tribal and non-tribal net fishery harvests in Puget Sound marine areas is 67,511 (60,726 tribal, 6,785 non-tribal) for all marine areas excluding 4B, 5, and 6, 6A, 6B, and 6C in the Strait (The current total landed catch statistic for these areas is 5,741, all tribal).. Additional tribal net harvest occurred in freshwater fisheries with a preliminary estimate of 54,385. Estimates of the sport catch in 2007 are not yet available. Historic catch tables for Puget Sound exclusive of the San Juans are provided in Appendix A.10.

#### ***1.3.2.3 Washington Coast***

Tribal commercial and ceremonial and subsistence fisheries harvested a total of 5,215 Chinook in north coastal rivers (Quinault, Queets, Hoh, and Quillayute) in 2007. An additional 332 Chinook were harvested by the Makah tribal fisheries in the Waatch and Sooes rivers.

Harvest in Grays Harbor includes catch from both the Humptulips and Chehalis rivers. The 2007 tribal net fisheries harvested an estimated 2,516 Chinook. The 2007 non-Indian commercial net

harvest in Grays Harbor was 514 Chinook. Approximately 4,108 Chinook were harvested by non-Indian commercial net fisheries in Willapa Bay in 2007.

From Grays Harbor north, recreational fisheries were implemented based upon pre-season tribal-state agreements and were subject to in-season adjustment. Estimates of sport fishery catches for Washington coastal terminal fishing areas in 2007 are not available. Historic catch estimates for Washington Coastal inside fisheries are shown in Appendix A.11.

Ocean fisheries off the coasts of Washington and Oregon are managed under regulations recommended by the Pacific Fishery Management Council. The estimated catch of Chinook salmon in commercial troll fisheries from Cape Falcon to the U.S.-Canada border in 2007 was 38,742 for both treaty and non-treaty fisheries combined. Estimated catch in the ocean recreational fishery north of Cape Falcon in 2007 was 9,535 Chinook. Historic catch estimates for U.S. ocean fisheries north of Cape Falcon are shown in Appendix A.12.

#### ***1.3.2.4 Columbia River***

Chinook from the Columbia River are divided into eight stock groups for management purposes. These groups are delineated by run timing and area of origin: (1) spring run originating below Bonneville Dam; (2) spring run originating above Bonneville Dam; (3) summer run originating above Bonneville Dam; (4) fall run returning to Spring Creek Hatchery; (5) fall run originating in hatchery complexes below Bonneville Dam; (6) wild fall run originating below Bonneville Dam; (7) upriver bright fall run; and (8) mid-Columbia bright fall hatchery fish.

In 2007, the total annual harvest for all fisheries (spring, summer and fall) in the Columbia River basin was 125,187 Chinook, which included non-Indian commercial net harvest of 28,170, sport harvest of 40,142 and treaty Indian commercial, ceremonial and subsistence harvest of 56,875 Chinook.

#### ***1.3.2.5 Ocean Fisheries, Cape Falcon to Humbug Mountain***

Most harvest in ocean fisheries off Oregon's coast is comprised of a mixture of southern Chinook stocks not included in the PSC agreement. These stocks do not migrate north into the PSC jurisdiction to any great extent. Some stocks originating from Oregon coastal streams do migrate into PSC fisheries, including the North Oregon Coastal (NOC) and Mid-Oregon Coastal (MOC) stock aggregates. The NOC stocks are harvested only incidentally in Oregon ocean fisheries, while the contribution of MOC stocks to Oregon ocean fisheries is believed to be much greater. Catch statistics are readily available only for a terminal area troll fishery on one MOC stock at the mouth of the Elk River. Late season (October-December) troll catch in the Elk River terminal troll fishery in 2007 was 1,018 Chinook.

Recreational catch of these two stock groups occurs primarily in estuary and freshwater areas as mature fish return to spawn and is reported through a "punch card" accounting system. These data are only available more than two years after the current season. Therefore, we can only report the riverine and estuarine sport catch though 2006 for the NOC and MOC groups. The 2006 punch card estimate of estuary and freshwater catch for the NOC and MOC groups is 39,357 Chinook. Historic catch estimates for the Elk River troll fishery and the estuary and freshwater sport fisheries targeting on MOC and NOC stocks are shown in Appendix A.14.

## 1.4 ESTIMATES OF INCIDENTAL MORTALITY FOR SOUTHERN U.S. FISHERIES

Table 1.10 shows estimates of incidental mortalities for Washington Coastal and Puget Sound fisheries. Sources of estimates are shown in the table footnotes. No estimates of incidental mortalities were provided for 2007 for ocean fisheries south of Cape Falcon or Columbia River fisheries.

Table 1.10. Estimated incidental mortality in Southern US troll, net, and sport fisheries for 2007.

## 2 ESCAPEMENTS THROUGH 2007

### 2.1 INTRODUCTION

The Agreement (Pacific Salmon Treaty Fishing Annexes & Related Agreements, June 30, 1999) established a Chinook management program that:

*"introduces harvest regimes that are based on estimates of Chinook abundance, that are responsive to changes in Chinook production, that take into account all fishery induced mortalities and that are designed to meet MSY or other agreed biologically-based escapement objectives"*

This chapter compares annual escapement estimates with maximum sustained yield (MSY) or other accepted biologically-based escapement goals established for Chinook stocks. The CTC has reviewed and accepted escapement goals for 24 stocks included in this report. For these stocks, the CTC can evaluate stock status in relation to the accepted goals. For stocks without accepted goals, the CTC must rely on the time series of escapement data and the agency commentary for the individual stocks to provide a perspective on stock status and escapement trends.

Annual reports prior to 2006 included a section on the framework used for escapement assessments and narratives for each stock that included a description of escapement methodology, escapement goal basis, and agency comments. For these more detailed stock narratives and descriptions of escapement methods, please refer to the 2004 Catch and Escapement Report (CTC 2005a).

#### 2.1.1 MSY or Biologically-Based Escapement Goals

##### 2.1.1.1 Origin of Goals

Escapement goals accepted by the CTC were based on analyses that followed the guidelines developed in the CTC escapement goal report (CTC 1999). In the stock-specific narratives presented with the escapement graphs, the agencies may refer to agency goals, but only CTC-accepted escapement goals and ranges (in gray shading) are shown on the escapement graphs and used for evaluation. Table 2-1 presents the status of escapement goal reviews by the CTC for stocks identified as escapement indicator stocks.

Table 2.1. PSC Chinook escapement indicator stocks, where shading indicates that there is not a CTC accepted escapement goal for PSC assessment of stock status.

<sup>1</sup> The escapement indicator stocks listed in the Annex tables for this group are Upper Fraser, Middle Fraser, and Thompson. The Fraser spring/summer group is split into these 4 escapement indicators to represent the stock group by life history type rather than geographically.

<sup>2</sup> An escapement goal was established for the Cowichan in 2005, a goal for Nanaimo is still pending.

## 2.2 ESCAPEMENT ASSESSMENT

The Agreement directs the CTC to "report annually on the escapement of naturally spawning Chinook stocks in relation to the agreed escapement objectives referred to below, evaluate trends in the status of stocks, and report on progress in rebuilding of naturally spawning Chinook stocks" (Annex IV, Chapter 3, paragraph 1.b.iii). In this report, escapement assessments include stock specific graphs of escapements and commentary, presented to provide a perspective on stock status and escapement trends through 2006. More detailed commentary for each stock can be found in previous CTC catch and escapement reports, e.g. CTC (2005a).

The escapement goals and 2007 escapements for the 24 stocks with CTC accepted escapement goals are listed in Table 2-2. For 12 of these stocks, the agency escapement goal is defined as a range; for the remaining 12 stocks, the escapement goal is defined as a point estimate. In 2007, escapements were within the goal range for seven stocks, above the range or  $S_{MSY}$  point estimate for four stocks, and below the goal for 13 stocks.

Table 2.2. Escapement goals and 2007 escapements for PSC Chinook escapement indicator stocks with biologically-based goals accepted by the CTC.

Stock	Region	Stock Group	Escapement Goal	2007 Escapement
Situk	SEAK	Yakutat	500-1,000	677
Alsek (Klukshu index)	SEAK/TBR	Yakutat	1,100-2,300	677
Chilkat	SEAK	Northern Inside	1,750-3,500	1,378
Taku	SEAK/TBR	TBR	30,000-55,000	17,516
Stikine	SEAK/TBR	TBR	14,000-28,000	16,038
King Salmon	SEAK	Northern Inside	120-240	179
Andrew Creek	SEAK	Central Inside	650-1,500	1780
Unuk (survey index)	SEAK	Southern Inside	650-1,400	720
Chickamin (survey index)	SEAK	Southern Inside	450-900	893
Blossom (survey index)	SEAK	Southern Inside	250-500	135
Keta (survey index)	SEAK	Southern Inside	250-500	311
Harrison	BC	Fraser River	75,100-98,500	79,176
Cowichan	BC	LGS	6,500	1,860
Mid Col. Upr. Summer	CR	Columbia River	17,857	21,557
Col. Upriver Brights	CR	Columbia River	40,000	54,278
Lewis	CR	Columbia River	5,700	3,468
Quillayute Fall	WAC	WA Coast	3,000	2,934
Queets Spring/Summer	WAC	WA Coast	700	352
Queets Fall	WAC	WA Coast	2,500	1,924
Hoh Spring/Summer	WAC	WA Coast	900	817
Hoh Fall	WAC	WA Coast	1,200	1,655
Nehalem	ORC	NOC	6,989	4,304
Siletz	ORC	NOC	2,944	528
Siuslaw	ORC	NOC	12,925	6,764

The CTC has now assessed the status of stocks with CTC-accepted goals for return years 1999-2007. Over this time period, the number of stocks with CTC-accepted goals has increased from 16 to 24 (Figure 2.1). From 1999-2006, the percentage of stocks below escapement goals or goal ranges has varied from 4% to 25%. In 2007, the percentage of stocks below goals or goal ranges increased to 54%.

Figure 2.1. Number and status of stocks with CTC-accepted escapement goals for years 1999-2007.

## 2.3 STOCK SPECIFIC GRAPHS AND COMMENTARIES

Graphs of time series of escapements and terminal runs for Chinook stocks are included in sections for Alaska, Canada, and Washington/Columbia River/Oregon. A limited commentary is also provided for each stock; more detail on historical assessments and escapement goals for individual stocks is available in CTC (2005a). Each graph contains the name of the stock and the type of data depicted (total escapement, index counts, terminal runs, etc.). For the graphs that include estimates of the terminal run size, the harvests in terminal runs include both jacks and adults in some cases, whereas the escapement is usually reported in adults. The x-axis represents calendar years. All escapement goals accepted by the CTC are shown except for the LGS stock group because this group includes both the Cowichan and Nanaimo stocks and only the Cowichan has a CTC accepted goal. Historical escapement and terminal run data are provided for SEAK stocks in Appendix B.1, for Canadian stocks in Appendix B.2, for Puget Sound in Appendix B.3, Washington Coastal stocks in Appendix B.4, for Columbia River stocks in Appendix B.5 and Oregon Coastal stocks in Appendix B.6.

### 2.3.1 SEAK/TBR Stocks

Of the 11 SEAK/TBR stocks included in the escapement assessment, the Situk, Chilkat, Taku, King Salmon, and Stikine rivers and Andrew Creek include estimates of total escapement of large fish, Chinook salmon > 659 mm mid-eye to fork (MEF) length. Escapement estimates for the Alsek, Unuk, Chickamin, Blossom, and Keta rivers are index counts of large fish. These indices are enumerated from a weir on the Alsek River and foot/aerial helicopter surveys on the

other four rivers that represent a fraction of the total escapement. Except for the Chilkat River, survey methods have been standardized for all systems since 1975. The assessment of Chilkat River Chinook salmon was standardized in 1991 as an annual mark-recapture estimate of escapement. Escapement goals have been defined as a range for the SEAK/TBR stocks, shown by the grey shaded area on the graphs.

The Situk River is a small non-glacial system that supports a moderate run of outside-rearing Chinook salmon. Escapements are based on weir counts minus upstream sport fishery harvests (if any) estimated from an on-site creel survey and a postseason mail-out survey. The weir has been operated annually since 1976, and was also operated from 1928-1955.

**Commentary:** The Alsek River is large Transboundary glacial system that supports a moderate run of outside-rearing Chinook salmon. Since 1976 index escapements (shown above) have been determined using a weir operated at the Klukshu River.

**Commentary** The Taku River is a large Transboundary glacial system that supports a large run of outside-rearing Chinook salmon. In 1989, 1990, and 1995-2006 escapements were determined using mark-recapture methods. In other years since 1975, aerial counts were expanded by a factor of 5.2, the 5-year average of the ratio of the mark-recapture estimates to aerial survey counts (McPherson et al. 2000).

**Commentary** The Stikine River is a large Transboundary glacial system that supports a large run of outside-rearing Chinook salmon. From 1975 through 1984 index escapements were made using survey counts and since 1985 counts were made using a weir at the Little Tahltan River. Since 1996 mark-recapture experiments were performed indicating the index escapements represented 17% to 20% of the total escapement (Pahlke and Etherton 1999).

**Commentary** The Chikot River is a moderate-sized glacial system moderate run of inside-rearing Chinook salmon. Since 1991, escapements have been estimated using mark-recapture methods (Ericksen and McPherson 2003). The current biological escapement goal of 1,750 to 3,500 was formally accepted by the CTC in 2005.

**Commentary:** The King Salmon River is a small non-glacial system that supports a small run of inside-rearing Chinook salmon. Escapements are based upon weir counts from 1983 to 1992 and expansions of index counts from 1971 to 1982 and 1993 to 2006. The 10 years of weir data showed that on average the escapement was 1.5 times the index count (McPherson and Clark 2001).

**Commentary:** Andrew Creek, a tributary of the lower Stikine River, is a small non-glacial system that supports a moderate run of inside-rearing Chinook salmon. Escapements are based upon weir counts from 1976 to 1984 and expansions of index counts in 1975 and 1985 to 2006. Four years of concurrent weir and index count data were used to estimate the expansion factor of 2.0.

**Commentary:** The Unuk River is a moderate-sized glacial system that supports a moderate run of inside-rearing Chinook salmon. Indices of escapement since 1977 are based on the sum of peak index counts from six main tributaries (Pahlke 2003). Mark-recapture studies were implemented in 1994 and annually since 1997 (Weller and McPherson 2003). The current estimated expansion factor is 5.0 for index counts.

**Commentary:** The Chickamin River is a moderate-sized glacial system that supports a moderate run of inside-rearing Chinook salmon. Indices of escapement since 1975 are based on the sum of peak index counts from eight main tributaries (Pahlke 2003). Mark-recapture studies were performed in 1995, 1996, and 2001-2005. The current estimated expansion factor is 4.6 for index counts.

**Commentary:** The Blossom River is a small-sized non-glacial system that supports a small run of inside-rearing Chinook salmon. Indices of escapement since 1975 are based on the sum of peak index counts (Pahlke 2003). Mark-recapture studies performed in 1998 and 2004 to 2006 estimated an expansion factor range of 2.0 to 4.0.

**Commentary:** The Keta River is a small-sized non-glacial system that supports a small run of inside-rearing Chinook salmon. Indices of escapement since 1975 are based on the sum of peak index counts (Pahlke 2003). Mark-recapture studies were performed 1998 to 2000 (Freeman et al. 2001). The current estimated expansion factor is 3.0 for index counts.

### 2.3.2 Canadian Stocks

Since the beginning of the Chinook rebuilding program of the 1985 PST, escapement goals for Canadian Chinook stocks were generally based on doubling the average escapements recorded from 1979-1982. The doubling was based on the premise that Canadian Chinook stocks were over-fished and that doubling the escapement would still be less than the optimal escapement estimated for the aggregate of all Canadian Chinook populations (see stock-recruitment curve in "Technical Basis of PSC Catch Ceilings," Figure 1, Attachment 4, PSC file 72006; PSC Office, Vancouver, BC). Doubling was also expected to be a large enough change in escapements to allow detection of the change in numbers of spawners and the subsequent production. The escapement goals of the Canadian stocks are currently being reviewed.

**Commentary:** The Yakoun River is the only significant Chinook-producing stream on the Queen Charlotte Islands. Chinook spawn primarily at the outlet of Yakoun Lake and are a summer-run stock. Visual estimates of escapement are made by foot surveys of the system. These estimates are then expanded into a total estimate of spawning escapement in the system. The effort spent on escapement surveys has declined in recent years and their accuracy (i.e. ability to estimate the actual escapement) is unknown.

**Commentary:** The Nass River is the largest river in Area 3, representing a group of approximately 25 streams in Area 3. Prior to 1992, CDFO observations of escapement were based on visual counts. Mark-recapture programs have been conducted since 1992 by the Niagara Fisheries to estimate total spawning escapement in the Nass River. The Nass mark-recapture program uses two fish wheels at Gitwinksihlkw (GW) in the lower Nass canyon to apply tags and two wheels at Grease Harbor in the upper canyon for recovery. A modified Petersen model, stratified by size category, was used to estimate the total population of Chinook past the tagging location. Tags were also recovered in upriver fisheries and on the spawning grounds. Spawning escapements were calculated as the estimated Chinook population past GW from the mark-recapture studies, less upriver catches in sport and First Nations fisheries. Three tributaries with Chinook populations enter the Nass River below GW. Visual estimates

augmented by fence counts of the Kincaid River in 2001, 2002, 2005 and 2007 were used to estimate Nass River Chinook escapements below the fish wheels.

**Commentary** The Skeena Chinook escapements above represent 40 streams within the Skeena watershed which are consistently surveyed. The Skeena supports over 75 separate Chinook spawning populations, but three (Kitsumkalum, Morice, and Bear Rivers) account for about 70% of the total abundance. A second group of populations (Ecstall, Kispiox, and Babine rivers) have annual returns ranging from 1,000 to 5,000 spawners, and comprise about 13% of Skeena returns. Escapement estimates are generally based on visual observations from helicopter, fixed wing aircraft and/or from stream walking surveys. Fish counting weirs are present on the Babine, Sustut and Kitwanga Rivers. The Kitsumkalum River is the exploitation rate indicator stock for the Skeena Chinook complex. Spawning escapements in the Kitsumkalum have been estimated using a mark-recapture program since 1984.

**Commentary** The Area 8 Chinook stock consists of seven non-enhanced systems, but the Dean River is the main spawning population. Of all Chinook-producing streams in the Central Coast, the Dean is the best indicator in terms of consistent survey coverage and methodology. Chinook returning to the Dean River have early-summer timing and most spawn in the lower river by

July. Up until 2000, counts of spawning Chinook were made during 1-3 surveys and the peak count used as the escapement index. Survey counts were sometimes expanded to account for sections of the river that could not be surveyed in any year, but the counts were not extrapolated to total escapement of Chinook to the river. Since 2001, the annual number of aerial surveys has increased, allowing the calculation of area-under-the-curve (AUC) escapement estimates. In some years viewing conditions were poor and did not result in counts necessary to produce an AUC estimate. In these years maximum likelihood estimates were used to produce estimates as was the case in 2004 (3,500). A Chinook mark-recapture program was initiated on the Dean River in 2006 to generate expansion factors for converting the current spawner indices (AUC estimates from helicopter flights) into estimates of total escapement. The preliminary estimate of escapement based on the mark-recapture program was 5,478 in 2006 compared to the maximum likelihood estimate of 3,689. For the purposes of this report however, the index of escapement is reported in the figures. Although no mark-recapture program was conducted in 2007, escapement was estimated at 2,300 based on an AUC.

**Commentary:** The Wannock, Chuckwalla, and Kilbella Rivers are the primary Chinook streams in Area 9 (Rivers Inlet area). Small tributaries of Owikeno Lake also contain Chinook but these populations are much smaller. The Wannock River contains the largest Chinook population, averaging 5,200 Chinook in the 1990s, while the Chuckwalla and Kilbella together averaged around 300. The Wannock River drains Owikeno Lake, is about six kilometers long, and is wide and turbid. The Chuckwalla and Kilbella rivers are much longer, drain from coastal mountains, and their visibility is much more variable depending on local weather (glacial flour to clear). The timing of these stocks also differs: the Wannock has late summer/fall run timing; the other two are early summer Chinook stocks. Escapement estimates in the Chuckwalla and Kilbella rivers are derived from aerial surveys, whereas Wannock escapement is derived from expansions of carcass count to estimate total spawning escapement.

**Commentary:** The WCVI index represents the sum of escapements for six rivers (Marble, Tahsis, Burman, Artlish, Kaouk, and Tahsish), which were chosen to provide an 'index' of escapement for wild WCVI stocks in general. These stocks were chosen based on historical consistency of data quality. CDFO has developed a 14 stream expanded index which includes escapements to the six stream index plus the following WCVI streams: Colonial/Cayegle Creeks (Area 26), Leiner (Area 25), Megin, Bedwell/Ursus, Moyeha (Area 24) and Sarita, Nahmint (Area 23), and San Juan (Area 21). In 2005, the Colonial/Cayegle escapement was not available, and was therefore not included in the 14 stream index. In 2007, a mark-recapture program was conducted on the Burman River, in addition to the regular swim and foot surveys. However, the escapement estimate used for the index followed the same methodology since 2005.

**Commentary:** The Upper Strait of Georgia (UGS) stock index consists of four river systems (Klinaklini, Kakweiken, Wakeman, Kingcome) in Johnstone Strait mainland inlets and the Nimpkish River on northeast Vancouver Island. The accuracy of escapement estimates in the mainland inlet systems is likely poor due to low visibility of glacial systems, remote access, and timing of surveys. Escapement estimates have primarily been based on aerial counts which may not encompass Chinook run-timing. Swim surveys and stream walks have been conducted in the Nimpkish River. A fish wheel program implemented on the Klinaklini in 1997 was discontinued in 2004. Based on the portion of the assessment program that continued in 2005, estimated abundance in 2005 was assumed to be the same as in 2004. Since 2006, the accuracy of the escapement estimate for the Klinaklini is considered to be very poor. Consequently, escapement for this stock was not included in the 2006 or 2007 index. No fish were observed in the Kakweiken River in 2006 or 2007.

**Commentary:** Lower Strait of Georgia (LGS) rivers monitored for naturally spawning fall Chinook escapement are the Cowichan and Nanaimo rivers. Total Chinook returns to the Cowichan and Nanaimo rivers have been estimated since 1975. Prior to 1988, escapement estimates from the Cowichan River were derived from swim surveys and over-flights by Fishery Officers and hatchery staff. This approach was also used for the Nanaimo River prior to 1995. Since 1988 a counting fence has been used in the Cowichan, and since 1995 carcass mark-recapture surveys have been used in the Nanaimo. Since 2005, AUC estimates have been used in the Nanaimo. In 2006, a tagging study was used to determine survey life specific to the system. An escapement goal of 6,500 for the Cowichan was accepted by the CTC in 2005; a goal for the Nanaimo is still pending.

### 2.3.3 Fraser River Stocks

The Fraser River watershed is the largest Canadian producer of Chinook salmon. Fraser Chinook are comprised of a large number of local populations as described in CTC (2002b).

Much of our understanding of the status of Fraser Chinook is based on spawner escapement data. Most data are from visual surveys, which are generally biased low, although many estimates are considered to be reasonably precise. Visual survey data are generated from aerial over-flight surveys and the escapement estimate is usually obtained by dividing the peak count by 0.65 (Farwell et al. 1999). The CDFO continues to evaluate the appropriateness of this expansion factor and AUC methodology through calibration studies. Counting fences and mark-recapture projects exist for some systems, although most of the time series of escapement data from these projects are relatively short.

For populations other than the Harrison River, habitat-based models are being developed to estimate spawning capacity and spawner abundance producing maximum sustained yield. This habitat-based assessment will initially focus on predictive models based on Chinook stock-recruitment relationships, although other habitat-based approaches will also be considered.

**Commentary:** This aggregate includes the Upper Pitt River and Birkenhead River stocks in the Lower Fraser, and the spring-run Chinook of the Mid and Upper Fraser, North Thompson, and South Thompson, but excluding those of the Lower Thompson (CTC 2002b). Stocks upstream of

Prince George include the McGregor and Torpy River systems. Fence counts are employed at the Salmon River in Salmon Arm (South Thompson). Estimates for all other systems were generated from aerial or ground-based surveys, typically, by dividing the peak count by 0.65. Escapements declined sharply in 2007, continuing the trend that started in 2004. Escapement to the aggregate was estimated at 11,737 in 2007; only 27% of the parent escapement in 2002, and similar to levels observed in the early 1980's.

**Commentary:** The Fraser Spring-Run Age 1.2 aggregate includes six smaller body size populations that spawn in the Lower Thompson River tributaries, Louis Creek of the North Thompson and the spring-run fish of Besette Creek in the South Thompson (CTC 2002b). Escapement estimates for each system are generated from visual surveys, either from aerial over-flights, stream walks or by dividing the peak counts by 0.65. The Nicola watershed is a site for calibrating peak count expansion, AUC, and mark-recapture methods. Escapements declined sharply in 2007 to less than 10% of parental brood escapements in 2003. The aggregate escapement was estimated to be 1407, and three stocks escaped less than 100 adult Chinook (Spius Creek, 64; Louis Creek, 18; and Besette Creek only 5 adults were estimated to have returned and spawned). Escapements at Nicola declined from 14,574 in 2003 to 941

**Commentary:** The Fraser Summer-Run Age 1.3 stock complex includes 10 populations, spawning in large rivers, mostly below the outlets of large lakes. These include the Nechako River upstream of Prince George, Chilko and Quesnel rivers in the mid Fraser and the Clearwater River in the North Thompson watershed (CTC 2002b). Escapement estimates are generated from visual (mostly aerial) surveys by dividing the peak count by 0.65, except for the Nechako River where multiple aerial counts are analyzed with the AUC method. Escapement surveys of the Stuart River and North Thompson River were discontinued in 2004 due to unreliable counting conditions. Escapements in 2007 continued to decline sharply. Aggregate escapement was estimated at 10,536, compared to the 2002 parental brood of 27,897.

**Commentary:** The Fraser Summer-Run Age 0.3 aggregate includes six populations of Chinook spawning in the South Thompson watershed upstream of Kamloops and one in the lower Fraser. These include the Middle Shuswap, Lower Shuswap, Lower Adams, Little River and the South Thompson River mainstem, in the BC interior, and Maria Slough in the lower Fraser (CTC 2002b). Most escapements are estimated by expanding peak visual survey counts (as in previous three Fraser aggregates). Further, the lower Shuswap River is a site for calibrating peak count expansion, AUC, and mark-recapture methods. Escapements to the 0.3 Summer Run aggregate were again strong in 2007. An estimated 85,722 chinook spawned, exceeding the aggregate escapement of 70,164 in the parental broodyear (2003). Middle and Lower Shuswap rivers and Maria Slough failed to reach parental escapement levels, while the Lower Adams, Little River and South Thompson all exceeded brood escapements. Returns to the South Thompson River were estimated to be 58,956 adults.

**Commentary:** The lower Fraser stock is dominated by fall returning Harrison-origin Chinook that includes natural spawners in the Harrison River and Harrison-origin fish that were introduced to the Chilliwack River. Since 1984, mark-recapture studies have been conducted annually on the Harrison River to obtain reliable estimates of spawning escapements. Estimates of fall Chinook escapement to the Chilliwack River are based on a procedure long established by the Chilliwack Hatchery staff for expanding the number of carcasses counted in standardized reaches of the river. Returns to the Harrison River were estimated to be 78,862 adult Chinook and 31,920 jacks. Natural spawning escapement to the Chilliwack River was estimated at 28,883 adults and 6,151 jacks. An additional 2,680 adults and 7,694 jacks returned to the Chilliwack River Hatchery.

### 2.3.4 Washington, Oregon and Columbia River Stocks

The PSC escapement indicator stocks in Washington, Oregon, and Idaho are separated into five groups: Puget Sound, Washington Coastal, Columbia River, North Oregon Coastal, and Mid Oregon Coastal. The indicator stocks include a variety of run timings and ocean distributions.

Biologically based escapement goals have been reviewed and accepted by the CTC for three fall stocks (Queets, Quillayute, Hoh), two Spring/summer stocks (Queets, Hoh), three Columbia River stocks (Lewis, Upriver Brights and Columbia River summer), and three Oregon coastal stocks (Nehalem, Siletz and Siuslaw).

**Commentary** In 2007, the escapement estimate was 1,438 for the North Fork and 182 for the South Fork. However, only 10% of the North Fork escapement is identified as natural-origin spawners, and the bulk of the run is composed of hatchery-origin returns from the supplementation program. The conservation objective for 2007 was for an Adult Equivalent (AEQ) exploitation rate across all southern U.S. fisheries not to exceed 7% (PFMC 2008). The state-tribal escapement goal established for this stock is 4,000 spawners. There is a small ceremonial and subsistence directed fishery on the spring Chinook and substantial incidental impacts during the terminal fall Chinook fisheries.

**Commentary** Due to changes in spawning index areas, beginning in 1992 for the Cascade stock and 1994 for the Sauk and Suiattle stocks, escapements are not directly comparable to previous numbers. The past state-tribal escapement goal of 3,000 adults was the average of the estimated escapements from 1959-1968 (PFMC 1997). In 2007 the Recovery Exploitation Rate (RER) for Skagit springs was 38%, with 576 spawners as the low abundance threshold. While no postseason estimate is available, the preseason expectation for 2007 was for a total rate of 18.4% (PFMC 2008). Proposed escapement goals, as stated in the draft Shared Strategy Recovery Plan, are 1,200 Chinook for low marine survival years and 2,100 Chinook for high marine survival years. The 2007 escapement estimate was 613 natural spawners, which does not include 11 spring chinook passed upstream at the Baker Lake trap before August 16.

**Commentary:** Projects to improve escapement estimates of Skagit summer/fall Chinook have recently been funded through the Letter of Agreement (LOA) process. They included: development of variance estimates, determination of age and sex composition of the escapement, and evaluation of the 21-day redd life assumption and 2.5 fish/redd expansion value. The state-tribal escapement goal for this stock is 14,850, the average of the 1965-1976 escapements (Ames and Phinney 1977). Little terminal harvest has occurred since 1997. In 2007, the Federal

Management Plan (FMP) conservation objective for this stock was for an exploitation rate not to exceed 17% in southern U.S. fisheries. The 2007 predicted exploitation rate was 14.0%. The 2007 escapement estimate was 11,291, which does not include 644 passed upstream at the Baker Lake trap. The terminal run estimate was 12,930.

**Commentary:** Natural spawning broodstock are collected annually in the river to maintain a CWT indicator stock program and to augment natural production. From 1989 to 1996, approximately 18% of the escapement was comprised of returns from this program. From 1996 to 2005, an average of 38% of the escapement was comprised of hatchery origin returns. The state-tribal escapement goal of 2,000 fish is the average of the 1973-1976 escapements (Ames and Phinney 1977). There have been no terminal harvests since 1996. The 2007 FMP conservation objective for the combined summer/fall stock was for an AEQ exploitation rate not to exceed 15% in the southern U.S. fisheries. The preseason estimate of this rate was 15.0%. The escapement estimate for 2007 was 785.

**Commentary:** Some terminal area harvest of Snohomish River Chinook occurs in Area 8 incidental to net and sport fisheries targeting Tulalip Hatchery Chinook salmon. Historic

terminal run size and catch estimates derived from run reconstruction are being revised to reflect the results of otolith marking studies. The state-tribal escapement goal for this stock had been 5,250 fish (the average of the 1965-1976 escapements). The FMP conservation objective was for a total AEQ exploitation rate not to exceed 15% in southern U.S. fisheries. The preseason prediction of that rate was 12.7%. The 2007 escapement was estimated at 3,982 natural spawners.

**Commentary:** Substantial artificial production occurs in Issaquah Creek and at the University of Washington. In 1994, spawning estimates were reviewed, and an attempt was made to find a consistent method to estimate escapement. A state-tribal escapement goal of 1,200 has been established for the Cedar River spawners. The single targeted goal represents an index count for the Cedar River. This objective reflects the average of observed spawning escapements from 1965-1969. It should be noted that although there are no hatchery fish released from the Cedar River, nearly 40% of the spawning fish were of hatchery origin. The FMP conservation objective for 2005 for Lake Washington Fall Chinook was for an AEQ exploitation rate not to exceed 15% in all preterminal southern U.S. fisheries. The preseason expected AEQ exploitation rate was 8.5%. The 2007 escapement was a total of 1,729 spawners. There have not been freshwater terminal fisheries on this stock since 1995

**Commentary:** There is a large hatchery program in this basin and these fish comprise a large portion of the return. The average is about 52% for the years 1996-2003. Tagging studies were conducted in 1975 and 1976 to estimate numbers of returning adults; results were in close agreement with estimates made from aerial surveys. No attempt is made to adjust the estimate of natural escapement for the presence of hatchery origin fish. Projects to improve escapement estimates of Green River fall Chinook, were recently funded through the LOA process, including evaluation of the spatial and temporal distribution of escapement, alternative methods of estimating escapement, and the validity of the 21-day redd life assumption and 2.5 fish/redd expansion value. The state-tribal escapement goal of 5,750 naturally spawning adults is the average of the 1965-1976 escapements (Ames and Phinney 1977). Beginning in 2003, a new method for estimating natural spawning escapement was employed based on mark/recapture studies conducted 2000-2002. The estimate of mainstem females was compared to the "adjusted" peak count of visible redds for that year, with the assumption that each female dug a single redd. In 2003, the mean ratio of mainstem females to mainstem adjusted peak redds (3.109) from the three study years was applied to the 2007 adjusted peak redd count to estimate mainstem female spawners. A sex ratio of 1.5 males per female was then used to expand the number of female spawners to total mainstem escapement. The 2007 FMP conservation objectives for this stock was for a total AEQ exploitation rate not to exceed 15% in pre-terminal southern U.S. fisheries, and an escapement of at least 5,800 adults. The 2007 escapement estimate for natural spawning Chinook was 7,186. The number of hatchery-origin spawners was estimated to be almost 60%.

**Commentary:** There are no directed fisheries on Chinook returning to rivers entering the Strait of Juan de Fuca. The escapement goal established by state and tribal managers is 850 naturally spawning adults. This single targeted goal was developed as a MSY proxy. The escapement goal was calculated by estimating the amount of available spawning habitat, then expanded utilizing assumed optimal redds per mile and fish per redd values (Ames and Phinney 1977). The 2007 escapement estimate was 570.

**Commentary:** A summer Chinook hatchery program using native stock operated from the mid-1970s to the mid-1980s. Spring Chinook of non-native origin were introduced in a hatchery program in the early 1970s. CWT analyses since then have demonstrated significant straying of these spring Chinook into the summer Chinook spawning population. Estimates from 1991-1995 averaged 47% hatchery origin strays in the naturally spawning population. In 1996, fry plants were eliminated and the smolt plants were reduced. Summer Chinook are managed for a fixed escapement goal of 1,200 adults and jacks combined (PFMC 2003). The 2007 escapement estimate for summer Chinook was 498.

**Commentary:** No hatchery production of fall Chinook currently occurs in the Quillayute River basin; the program was discontinued in the late 1980s. Since 1991, the returning run size has fluctuated within a range comparable to run sizes observed prior to 1984. The 2007 escapement estimate was 2,934, with a total terminal estimate of 3,839. Terminal fisheries are managed for a harvest rate of 40%, with an escapement floor of 3,000 fish (PFMC 2003). This objective is designed to actively probe at and above estimates of escapements that produce maximum sustained harvest (MSH), while minimizing potential detrimental effects of existing fisheries. Stock production analyses of spawning escapements from 1968-1982 were used to determine the initial escapement floor.

**Commentary:** Similar to many of the other Washington coastal stocks, Hoh River spring/summer escapements have been relatively stable except for much larger returns in 1988, 1989, and 1990. The terminal return for this stock declined from 1997 to 2000, but has since rebounded. Terminal fisheries are managed to harvest 31% of the river run, with an escapement floor of 900 fish (PFMC 2003). This objective is designed to allow a wide range of spawner escapements from which to eventually develop an MSY objective or proxy while protecting the long-term productivity of the stock. Stock production analysis of spawning escapement for brood

years 1969-1976 was utilized to determine the initial escapement floor. The 2007 escapement estimate and total run size were 750 and 1,019 respectively.

**Commentary:** The natural escapement estimates for the Hoh River fall Chinook include fish taken for broodstock in the 1980s. This stock is managed to harvest 40% of the terminal run, with an escapement floor of 1,200 spawners (PFMC 2003). This objective is designed to actively probe at and above estimates of the escapements that produce MSH, while minimizing potential detrimental effects of existing fisheries. Stock production analyses of spawning escapements from 1968-1982 were utilized to determine the initial escapement floor. The 2007 escapement estimate was 1,655. Terminal run size estimate was 2,734.

**Commentary:** Terminal fisheries are managed to harvest 30% of the river run size, with an escapement floor of 700 fish (PFMC 2003). This objective is designed to actively probe at and above the estimates of escapement that produce MSH. Since 1990, terminal fisheries have had minimal impact on this stock as returns to the river have rarely exceeded the escapement floor in this time frame. Since 2000, sport anglers have been required to release all Chinook during the summer, and tribal fisheries have been limited to one tribal netting day for ceremonial and

subsistence purposes. Stock production analysis of spawning escapement for brood years 1969-1976 were used to determine the initial escapement floor. The 2007 escapement estimate was 353, with a terminal run size of 358.

**Commentary:** For Queets River fall Chinook, the 2007 escapement was 768 and the terminal run was 1607. Terminal fisheries are managed to harvest 40% of the river return, with an escapement floor of 2,500 spawners (PFMC 2003). This objective is designed to actively probe at and above estimates of the escapements that produce MSH. Stock production analyses of spawning escapements from 1967-1982 were used to determine the initial escapement floor.

**Commentary:** The Grays Harbor spring Chinook stock is managed for a fixed natural spawning escapement goal of 1,400 fish (PFMC 2003). This single targeted goal was developed as a MSY proxy. This objective was derived from actual spawning data from the mid- to late 1970s, expanded to include additional habitat not covered by spawner surveys. The 2007 escapement was 666 Chinook and the 2007 terminal run 1067.

**Commentary:** Grays Harbor fall Chinook are managed for a maximum sustained production escapement goal of 14,600 spawners for the Chehalis and Humptulips systems combined (PFMC 2003). This single targeted goal was developed as an MSY proxy. The objective represents assumed optimal spawner density based on estimated available habitat. The 2007 escapement was 12,105 Chinook. The terminal run was 16,566 Chinook salmon.

**Commentary:** The upriver spring/Snake River summer Chinook escapement in the graph was calculated as the dam count at Bonneville Dam from March 15 through June 15 multiplied by the proportion of wild spawners estimated from run reconstruction, minus an estimate of wild harvest above Bonneville Dam. In 1992, Snake River spring/summer naturally spawning Chinook were listed under the ESA. The interim management goal for the Columbia River Fish Management Plan (CRFMP 1988) for Columbia River Springs was 115,000 hatchery and wild adult Chinook counted at Bonneville Dam and 25,000 naturally produced plus 10,000 hatchery produced adults counted at Lower Granite Dam. However, the CRFMP is currently being renegotiated. Terminal harvests were severely constrained from 1977 until 2000, with incidental harvests in lower river fisheries averaging 2% and total harvest in treaty Indian fisheries averaging 5.5% (TAC 1999). Since 2001, the terminal harvest rates have been between 13.5%

and 19.0%. In 2007, the escapement for Columbia Upriver Springs was 16,485 and terminal run of 18,203.

Commentary: Productivity of Upper Columbia River Chinook salmon is limited by loss of downstream migrants, habitat degradation, lack of screens on water diversions, high water temperatures, low flows, and sediment-laden irrigation water returns (CBFWA 1990). The CTC (1999) developed an interim biologically based MSY escapement goal of 17,857 wild upper-Columbia summer Chinook past Bonneville Dam based on PSC Chinook model data. The methods used to reconstruct the escapements for developing the goals are different than the current methods used to estimate upper-Columbia escapements, graphed above. Also, the historical time series of escapement estimates in the TAC run reconstruction have changed. A revised goal using the current escapement data will be reviewed by the CTC in 2008. The 2007 escapement was 21,557 naturally spawning fish. Directed commercial fisheries for upper Columbia River summer Chinook resumed in 2003 above Bonneville Dam and in 2004 below Bonneville Dam because the Columbia Upriver Summers exceeded the interim management goal of 29,000 hatchery and natural origin adults as measured at the Columbia River mouth. The non-Indian and tribal harvest rates in 2007 were 9.5% and 14.7%, respectively.

**Commentary:** The escapement goal for the Columbia River Upriver Bright Chinook is 40,000 naturally spawning fish past McNary dam. The 2002, 2003, and 2004 escapements past McNary dam of 116,237, 160,677, and 150,440 were the largest since the peak escapement and terminal run in 1987. The 2007 escapement was 45,719 through McNary Dam.

**Commentary:** The escapement goal for the Lewis River is 5,700 naturally spawning fish. Except in 1999, escapements have been above the goal since 1979. The 2002, 2003, and 2004 returns and escapements of Lewis River fall Chinook were the largest since 1990. The estimated escapement in 2007 was 3,468 Chinook, the first time since 1999 that the escapement has been below goal.

**Commentary:** Local management agencies use a goal of 4,000 adult Chinook, which includes 2,000 fish above Sherars Falls. This goal is based on average spawning escapement. The 2002 and 2003 escapements of Deschutes fall Chinook were at least 3 times the management goal, based on either the expansion of escapements above Sherars Falls, or the total river mark recapture estimate. They were also the largest escapements since the peak in 1997. The estimated escapement in 2007 was 13,181 Chinook.

**Commentary:** Methods used to generate escapement estimates are derived from calibration studies funded through the USCTC-LOA studies conducted in the Nehalem River basin from 2000-2004. The results of these studies indicate that peak counts from "standard" spawner surveys track the true Chinook escapement into the basin relatively well. Standard surveys are defined as those surveys which have historically been conducted by regional staff for 20+ years. Peak count is defined as the largest sum of live Chinook and carcasses observed on a particular day, per mile over a defined survey reach. The Chinook Technical Committee requires that a Coefficient of Variation (CV) of <30% must be achieved in order for an index be used as an estimator of abundance within the Chinook management scheme.

The index for this assessment is .00528 with a CV of 31%. The spawner escapement estimate for the Nehalem Basin (excluding the North Fork) based on this index value was 5,193 fall Chinook. Punch card data used to estimate the recreational sport catch are unavailable for 2007; hence terminal run sizes are not available for this year. Methods directly comparable to those used to generate the agreed to escapement goal for the Nehalem indicate 2007 escapement of 4,304 adult spawners. This is 62% of the current escapement goal. This is the second consecutive year of this stock's failure to meet agreed-to escapement goals. The Oregon Department of Fish and Wildlife is anticipating being under escapement goal based on forecasts of recruitment for this stock in 2008. Forecasted escapement based on sibling regression methods predicts 2008 escapement of 6,378 spawning adults. Consequently, the department is structuring terminal fisheries in 2008 with the intent to meet its general obligation under the ISBM agreement.

**Commentary:** Calibration studies continue through the 2008 spawning year thus traditional methods of escapement estimation remain in place until the Mark-Recapture calibration study is complete. Methods used to generate escapement estimates in this basin in relation to the established escapement goal have not changed since the 2005 report. The estimate based upon historically produced habitat expansion for 2007 was 528 adult fall Chinook salmon. This is the lowest estimate of spawning adults returning to the Siletz since the beginning of a dataset going back to 1975. Punch card data used to estimate the recreational sport catch are not yet available for 2007; hence terminal run size estimates from this method are not available for this year. This escapement estimate is substantially below the basin's escapement goal, and the forecast based on sibling regression methods (1,723 adult spawners) for the coming escapement year does not indicate an anticipated improvement in escapement in the 2008 return year. Consequently, the ODFW anticipates being under ISBM general obligation, and is currently structuring terminal fisheries with the intent to comply with needed reductions in terminal catch not only in this basin and the other escapement indicator stocks in the NOC aggregate, but on a coast-wide basis. These actions have been presented to the Oregon Fish and Wildlife Commission for review and are anticipated to take effect upon approval prior to the beginning of the terminal fall fishing season. Alternate estimates of escapement generated by the ongoing Mark-Recapture study funded through the auspices of the 1996 LOA agreement indicate 2,793 spawning adults, and a terminal sport fishing harvest of 1,439 fish in 2007.

**Commentary:** The estimated spawner abundance in 2007 was 1,491 adult Chinook. Methods used to generate escapement estimates in this basin are based on five years (2002-2006) of calibrated peak counts on six standard surveys to mark & recapture estimates in the Siuslaw basin. The index value is 0.01054 with a SD of 16%. Escapement goal estimate analysis was based upon available habitat expansion estimates used in other basins on the Oregon coast which have been obviated through the improvement of estimation techniques based upon Mark-Recapture estimates. Escapement estimates based on these methods indicated escapement below the CTC adopted escapement goal of 12,925 for the past two years (6,965 in 2006, 1,491 in 2007) however these estimates are not comparable to the currently agreed to escapement goal. Escapement estimates based on methods used to generate the agreed to goal result in an estimated 6,764 adult spawners. Spawner-recruit analysis utilizing the updated data set is planned for the near future to compare between newer escapement estimation (backcast through historical data-sets) and an escapement goal based upon the same data. Punch card data used to estimate the recreational sport catch are not yet available for 2007; hence terminal run size estimates from this method are not available for this year. As with the remainder of the aggregate, management measures are being taken to reduce the terminal catch in the Siuslaw to provide for greater escapement to the spawning grounds for the 2008 return year.

**Commentary:** Coded-wire tagged fall-run Chinook from the Umpqua River have indicated that they are harvested in PSC fisheries. Four years of USCTC funded research has allowed the calibration of the redd counts to derive a fish per redd expansion factor so that annual escapements estimates can be made. The average expansion factor from these studies is 3.69 fish per redd. The coefficient of variation of the expansion factor was found to be 14%, which shows that the average expansion factor is a reliable statistic to use for annual estimates of escapement. The escapement estimate for 2007 was 2,457 based on redd count expansions.

Indexes of Chinook spawner abundance in the South Umpqua/Cow creek sub-basin were derived from aerial redd count surveys. The aerial surveys are funded by Douglas County and were conducted twice during the spawning season. Aerial redd counts were conducted on the lower 69 miles of the South Umpqua and the lower 60 miles on Cow Creek. These counts cover all mainstem spawning areas for fall Chinook in the South Umpqua Basin. The South Umpqua is broken up into three reaches (Forks to Happy Valley, Happy Valley to Cow Creek, Cow Creek to Milo) and Cow Creek is considered one reach from the confluence with the Umpqua River to Galesville Dam.

The Coastal Chinook Research and Monitoring project was able to provide a calibration of redds to spawner escapement estimate based on the years 1998 through 2003 excluding 2002 when aerial flights were not conducted. The mean number of fish per redd estimated from these five years was 3.4 with a coefficient of variation of 17.8%

Aerial surveys are conducted using a Bell Ranger 3 helicopter and flights are typically scheduled to encompass the peak spawning period. Two biologists simultaneously count redds for each reach using hand tally-counters. At the end of the reach, each biologist will record the number of redds identified, and counters reset for the next reach. The average of the two observers Chinook redd count from reach will be determined for both flights. The index is defined as the sum of the peak counts for each reach between the two flights. Expansions are sometimes made to account for portions of reaches that were not completed due to visibility or mechanical problems.

Terminal run estimation is currently being conducted and will require some measure of data mining in order to reconstruct what the terminal catch has been historically. Preliminary indications are that the terminal catch of South Fork Umpqua Chinook is insubstantial.

**Commentary:** Methods of estimation based on Mark-Recapture calibrated analysis indicate an adult Chinook escapement for the Coquille basin of 2,578 spawners. Habitat-expansion based estimates indicate an escapement of 2,098 adult fish. Analysis funded by the CTC is underway that will provide information to designate Coquille Fall Chinook as an escapement indicator stock for the Mid-Oregon Coast (MOC) Aggregate. Calibrated index of peak counts on standard surveys to a relatively precise mark & and recapture abundance estimates has been selected as an efficient and cost effective means to measure spawner escapement of Chinook salmon for use in PST fisheries management.

The Chinook Technical Committee requires that a Coefficient of Variation (CV) of <30% must be achieved in order for an index be used as an estimator of abundance within the Chinook management scheme. The CV between the qualifying calibration values computed from studies conducted from 2001 through 2004 for the Coquille River basin is 14%, and the average index value of 0.00874. This analysis include eight standard survey conducted annually on a regular basis. The calibration value is defined as the average peak count per mile of the eight standard surveys divided by the point value of the Petersen estimate. Peak count is defined as the largest sum of live Chinook and carcasses observed on a particular day, per mile over a defined survey reach.

### **3 EXPLOITATION RATE ANALYSIS AND MODEL CALIBRATION**

#### **3.1 INTRODUCTION**

This chapter describes the methods and results of the cohort analysis, used to estimate exploitation rates from CWT data, and the PSC Chinook model calibration. The results of the 2008 preseason calibration (CLB 0805) are based on the exploitation rate analysis using CWT data through 2006, coast-wide data on catch, spawning escapements and age structure through 2007, and forecasts of Chinook returns expected in 2008. This chapter includes:

- 1) estimated postseason abundance indices for 1979 through 2007 and the preseason projection for 2008 for the AABM fisheries,
- 2) estimated non-ceiling indices, referred to as the ISBM indices in this report, for 1999 to 2006 and modeled ISBM projections for the 2008 ISBM fisheries,
- 3) estimated stock composition for 1979 through 2007 and a projection for 2008 for the AABM and other fisheries, and
- 4) estimated harvest rates (fishery indices) for the AABM fisheries.

Appendix C shows the relationship between the exploitation rate indicator stocks, model stocks, and PST Annex stocks. Appendices D to K present some additional output from the exploitation rate analysis and model calibration beyond the summaries presented in this Chapter. Appendix D provides the time series of ISBM CWT indices, and ISBM model indices from calibration 0805. Appendix E shows the percent distribution of landed catch and total mortality by catch year for exploitation rate indicator stocks. Appendix G has the time series of brood year exploitation rates for the CWT indicator stocks. Appendix H shows the model estimates of stock composition in AABM and other sport and troll fisheries. Appendix I lists the incidental mortality rates used in the CTC model. Appendix J gives the time series of total AIs for the AABM fisheries, and Appendix K provides the AIs for each model stock for each AABM fishery. Appendix L presents the time series of CWT-based fishery exploitation rate indices by stock, age, and fishery.

#### **3.2 METHODS**

A complete description of methods for the exploitation rate analysis and model procedure is reported in TCCHINOOK (05)-2 (CTC 2005b). The exploitation rate assessment is performed through cohort analysis of CWT release and recovery data (CTC 1988). Cohort analysis is the reconstruction of the exploitation history of a given stock and brood year and is used to produce a variety of statistics, including total exploitation rates, age and fishery specific exploitation rates, maturation rates, pre-age 2 recruitment survival indices (Appendix F), and annual distribution of fishery-related mortalities.

Estimates of age and fishery-specific exploitation and maturation rates from the cohort analysis are combined with data on catches, escapements, non-retention, and enhancement to complete the annual calibration of the CTC Model. The calibration procedure estimates pre-age 2 survival to recruitment for the stocks included in the model.

Results from the annual preseason calibration of the Chinook model are used to calculate: 1) AIs for the three AABM fisheries; 2) postseason AIs for the previous year; and 3) preseason and postseason ISBM indices. Projected AIs for 2008 are used to determine the allowable 2008 catch of Treaty Chinook for AABM fisheries. Postseason AIs are used to determine postseason allowable catches and to evaluate compliance for AABM fisheries. For the ISBM fisheries, the Agreement specifies that Canada and the United States will reduce the exploitation rate from the 1979–1982 base period by 36.5% and 40.0%, respectively, on stocks that have not achieved their CTC agreed escapement goals. The ISBM index is used to estimate the annual reduction in exploitation rates relative to the base period. Postseason ISBM indices for 2007 are computed using results of the exploitation rate analysis. Forecasts of the 2008 ISBM indices are computed using the CTC model. The Agreement specifies that the postseason ISBM indices estimated through exploitation rate analysis of CWT recoveries will be used to assess the ISBM index.

### **3.3 CHANGES IN THE 2008 CHINOOK MODEL CALIBRATION - #0807**

- 1) Preliminary recent year catches through 2006 were updated to final numbers in all fisheries.
- 2) North troll, Central troll, WCVI troll and Georgia Strait troll catches in the ceiling file were converted from calendar year to accounting year catches (Oct. 1 through Sept. 30) for all years. Prior to 2008 only the catches from 1999 onward were reported based on the accounting year in these fisheries.
- 3) The Georgia Strait sport catch data for the years 2000 through 2007 was updated based upon an internal revue by CDFO and the reconciliation of several competing catch accounting systems.
- 4) Preliminary recent year escapements and terminal runs through 2006 were updated to final numbers for all stocks.
- 5) The combined Cowichan and Nanaimo (GST) escapement data in the forecast file was updated from 1982 onward due to an internal review and update of the escapement numbers by CDFO.
- 6) FPs were set near zero for WCVI stocks in WCVI Troll FPA file. Stock specific FP's were calculated for Puget Sound and Columbia River stocks in the WCVI Troll FPA file.
- 7) The Exploitation Rate Analysis used updated data for most Columbia River net catches, as well as updated escapement data on Oregon coastal stocks. Methods to extrapolate sampling fractions were developed for the net catches similar to last years ERA. These changes in turn affected the FP values for various fisheries.
- 8) The North Oregon Coast aggregate stock changed from a recent 3 year average escapement forecast to a sibling-regression based forecast in the forecast file.

### **3.4 EXPLOITATION RATE ASSESSMENT (THROUGH CALENDAR YEAR 2006)**

The CTC currently monitors 43 exploitation rate indicator stocks that are coded-wire tagged, but only 40 were used for analyses in this chapter (Table 3.1). Four new ER indicator stocks were added to the CTC ER assessment: Nanaimo, Nicola, Dome, and Lower Shuswap. An exploitation rate indicator stock is not used in the exploitation rate analysis if the number of CWT recoveries is very limited (minimum of 35 estimated recoveries for a given stock and age combination) or there is no quantitative estimate of tags in the spawning escapement (see footnotes in Table 3.2). Indicator stocks used for exploitation rate analysis and the type of analysis performed for each are shown in Table 3.2. The relationship between the exploitation rate indicator stocks, model stocks, and PST Annex stocks are shown in Appendix C. Extrapolation of results to similar stocks and/or generalizations about fishery impacts will only be appropriate to the extent that the exploitation rate indicator stocks are representative of the stocks groups they are intended to represent.

Table 3.1. Exploitation rate indicator and DIT stocks, their location, run type, and smolt age.

Stock/Area	Exploitation Rate Indicator Stocks	Hatchery	Run Type	Age
Southeast Alaska	Alaska Spring	Crystal Lake, Whitman Lake, Little Port Walter, Deer Mountain, Neets Bay	Spring	Age 1
North/Central BC	Kitsumkahum	Terrace	Summer	Age 1

<sup>1</sup> For stocks of hatchery origin and subject to terminal fisheries directed at harvesting surplus hatchery production, ocean fisheries do not include terminal net fisheries. Otherwise, total fishery includes terminal net fisheries.

<sup>2</sup> Hatchery stock not used to represent naturally spawning stock.

<sup>5</sup> Only fishery rack recoveries are included in escapement

<sup>6</sup> Insufficient escapement data for exploitation rate analysis

### 3.5 MODEL OUTPUT

#### 3.5.1 AABM Abundance Indices and Associated Catches

Beginning with the 1999 fishing season, the Agreement specified that the AABM fisheries are to be managed through the use of the preseason AIs, where specific allowable harvest corresponds to a given AI for each fishery. The preseason AIs that were used to establish harvest management targets are listed in Table 3.3. The 2008 preseason AI for the SEAK troll fishery is 1.07, for the NBC troll fishery it is 0.96, and for the WCVI troll fishery is 0.76. In-season predictors may also be used for in-season adjustments to the preseason AI's for the SEAK troll fishery. However, the in-season AI has not provided a reliable estimate of the postseason AI due to its reliance on the preseason AI in the calculations and has not been used for in-season management action since 2001.

The postseason AI is considered a more accurate estimate of the abundance index for the AABM fisheries, and is used to compute a final allowable catch for each fishery to evaluate overage or underage of the landed catch relative to the harvest objective. Postseason AIs for 1999-2007 are also listed in Table 3.3.

Table 3.3. Abundance indices for 1999 to 2008 for the SEAK, NBC, and WCVI troll fisheries.

Year	Calibration	SEAK			NBC		WCVI	
	Preseason/ Postseason	Preseason	Inseason	Postseason	Preseason	Postseason	Preseason	Postseason
1999	9902 / 0107	1.15	1.15	1.12	1.12	0.97	0.60	0.50
2000	0021 / 0107	1.14	1.14	1.10	1.00	0.95	0.54	0.47
2001	0107 / 0206	1.14	1.10	1.29	1.02	1.22	0.66	0.68
2002	0206 / 0308	1.74	1.73	1.82	1.45	1.63	0.95	0.92
2003	0308 / 0404	1.79	1.76	2.17	1.48	1.90	0.85	1.10
2004	0404 / 0506	1.88	1.88	2.06	1.67	1.83	0.90	0.98
2005	0506 / 0604	2.05	2.04	1.90	1.69	1.65	0.88	0.84
2006	0604 / 0705	1.69	1.69	1.73	1.53	1.50	0.75	0.68
2007	0705 / 0805	1.60		1.34	1.35	1.10	0.67	0.57
2008	0805	1.07			0.96		0.76	

The Agreement specifies the allowable catch for various values of the AI for each fishery. The allowable treaty catch by fishery and year based on pre- and postseason AIs and the actual (observed) catches are given in Table 3.4 and are shown in Figures 3.1 through 3.3; the solid line represents the relationship between AIs and allowable catch under Table 1 of the annex.

Table 3.4. Observed catches and postseason allowable catches for 1999 to 2007, and preseason allowable catches for 1999 to 2008, for AABM fisheries.

Year	PST Treaty Allowable and Observed Catches								
	SEAK (T, N, S) <sup>1</sup>			NBC (T, S)			WCVI (T, S)		
	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch	Pre-season Allowable Catch	Post-season Allowable Catch	Observed Catch
1999	192,800	184,200	198,842	145,600	126,100	86,726	128,300	107,000	36,413
2000	189,900	178,500	186,493	130,000	123,500	31,900	115,500	86,200	101,438
2001	189,900	250,300	186,919	132,600	158,900	43,500	141,200	145,500	117,670
2002	356,500	371,900	357,133	192,700	237,800	150,137	203,200	196,800	165,036
2003	366,100	439,600	380,152	197,100	277,200	191,657	181,800	268,900	175,821
2004	383,500	418,300	428,773 433,446 <sup>2</sup>	243,600	267,000	241,508	192,500	209,600	216,624

#### 3.5.1.1 Model estimates of stock composition of AABM fisheries, 1979-2008

There are 30 model stocks (Appendix C). However, the majority of model catches in AABM fisheries are often composed of a few smaller set of major stocks (Figures 3.7 through 3.9). The relative abundance for each major stock is shown in those graphs from CLB 0805. In general, postseason AIs had a peak during the late 1980s and another in 2003 and 2004.

Figure 3.7. Total abundance indices for the SEAK troll fishery with annual stock composition indicated by abundance indices for major model stocks from CLB 0807.

The major model stocks contributing to the SEAK AIs are: WCVI Natural and Hatchery, Upriver Brights, North/Central BC, and Oregon Coastal (Figure 3.7). The "other" category is primarily driven by Upper Georgia Strait, Columbia River Summers, and Mid Columbia River Brights.

Figure 3.8. Total abundance indices for the Northern BC troll fishery with annual stock composition indicated by abundance indices for major model stocks from CLB 0807.

The major model stock groups contributing to the NBC AABM fishery AIs are: WCVI Natural and Hatchery, Upriver Brights, Oregon Coastal, North/Central BC, and Washington Coastal Wild and Hatchery (Figure 3.8). The "other" category is primarily driven by Columbia River Summers, Mid Columbia River Brights and Willamette Springs.

Figure 3.9. Total abundance indices for the WCVI troll fishery with annual stock composition indicated by abundance indices for major model stocks from CLB 0807.

The major model stock groups in the WCVI fishery are: Fraser Late, Puget Sound, Upriver Brights, and Columbia River Tules (Figure 3.9). The "Other" category is comprised primarily of Columbia River Summers and Oregon Coastal fish.

### 3.5.2 Overages and Underages

Until an approach for full implementation of overage/underage provisions has been developed and accepted by the PSC, the Commissioners have instructed the CTC to track and report overages and underages relative to agreed-upon harvest objectives.

#### 3.5.2.1 AABM Fisheries

Table 3.5 shows the differences between the postseason allowable catches and the observed catches in AABM fisheries for 1999–2007, and the cumulative differential for those years. All three AABM fisheries have cumulative underages. In SEAK, observed catches have been below final allowable catches for three of the nine years; the cumulative differential is -1.5% or -1.3%.

In NBC, observed catches have been below the final allowable catches in seven of the nine years; the cumulative differential is -24.0%. In WCVI, observed catches have been below allowable catches in four of the nine years; the cumulative differential is -10.9%.

Table 3.5. Deviations in numbers of Chinook salmon and percentages from catch targets derived from the first postseason AI (Table 3.2) for Pacific Salmon Treaty AABM fisheries in 1999 to 2007.

Year	SEAK		NBC		WCVI	
	Number of Fish	Percent Difference	Number of Fish	Percent Difference	Number of Fish	Percent Difference
1999	+14,642	+7.9%	-39,374	-31.2%	-70,587	-66.0%
2000	+7,993	+4.5%	-91,600	-74.2%	+15,238	+17.7%
2001	-63,381	-25.3%	-115,400	-72.6%	-27,830	-19.1%
2002	-14,767	-4.0%	-87,663	-36.9%	-31,764	-16.1%
2003	-60,081	-13.7%	-85,543	-30.9%	-93,079	-34.6%
2004	+1,281 +3,366	-0.3% +0.8%	-25,492	-9.5%	+7,024	+3.35%
2005	3,082	+0.8%	2,906	+1.2%	+22,962	+12.8%
2006	3,178	+0.9%	15,985	+8.0%	+1,383	+1.0%
2007	67,938	+26.2%	1,235	+0.9%	+17,250	+14.2%
Cum.	-42,678 -38,031 <sup>1</sup>	-1.5% -1.3% <sup>1</sup>	-424,946	-24.0%	-159,403	-10.9%

<sup>1</sup> The lower value results from subtracting a terminal exclusion catch for the Stikine River in 2004, which is in dispute.

### **3.5.2.2 ISBM Indices by Stock**

For ISBM fisheries, the Agreement specifies that Canada and the United States will reduce base period exploitation rates on specified stocks by 36.5% and 40%, equivalent to ISBM indices of 63.5% and 60% percent, respectively. This requirement is referred to as the 'general obligation' and does not apply to stocks that achieve their CTC agreed escapement goal. Estimated ISBM fishery indices are shown in Table 3.6 for Canadian fisheries and Table 3.7 for U.S. fisheries. Both tables present CWT-based indices for 2006, and Chinook model-based predicted indices for 2008. The agreement specifies that the indices for postseason assessment be assessed using the CWT-based estimates, 2006 is the most recent analysis available. CWT-based indices for 1999-2006 and model-based indices for 2001-2007 are presented in Appendix D.

#### **3.5.2.2.1 CWT-based Indices in 2006**

Canadian ISBM indices from the CWT-based estimates for 2006 were reduced more than required under the agreement for five of the six CWT indices which could be calculated, the exception being WCVI Falls (Table 3.6). Several inconsistencies were identified in the way these indices had been computed in the past, as noted in the footnotes 4-9 in Table 3.6. Most of them were inconsistencies between the way indices had been calculated by the model versus in the CWT exploitation rate assessment. However, in the case of Lower Georgia Strait, Nanaimo was dropped from the CWT-based index because of concern about the way the terminal fishery rates were estimated. In addition, Nanaimo and Cowichan stocks are no longer reported separately in the model-based index because a way to split the two stocks in the base period has not yet been developed.

Four of the 16 U.S. ISBM indices for the CWT-based estimates for 2006 were reduced more than required. Of the U.S. CWT-based ISBM indices that exceeded 0.60, 10 (Upriver Brights, Quillayute, Queets, Hoh, Lewis, Mid-Columbia Summers, Nehalem, Siletz, Siuslaw and Cowichan) have agreed escapement goals and all but the Cowichan stock exceeded their goals in 2006. Figures 3.10 and 3.11 show the historical ISBM indices based on CWT recoveries for 1999-2006.

Figure 3.10. CWT-based ISBM indices for Canadian fisheries for 1999-2006. Value in brackets on stock axis is the 2006, percent of escapement goal.

Figure 3.11. CWT-based ISBM indices for U.S. fisheries for 1999-2006. Value in brackets on the stock axis is the 2006, percent of escapement goal.

### 3.5.2.2.2 Predicted ISBM Indices for 2008

Model projected indices (Table 3.6) show that the Canadian ISBM indices are expected to be below 0.635 for all Canadian stocks. Canadian indices are projected to be above 0.635 for Puget Sound stocks and below 0.635 for other U.S. stocks. In the southern U.S. fisheries (Table 3.7) eight stocks are projected to have ISBM index values over 0.60, all of which have agreed escapement goals. Five of these eight stocks were below goal in 2007.

Table 3.6. Canadian 2006 ISBM indices based on CWT and the 2008 indices predicted from the PSC Chinook Model.

Stock Group	Escapement Indicator Stock	Canadian ISBM Indices	
		CWT Indices for 2006	Model Indices for 2008
Lower Strait of Georgia	Cowichan Nanaimo	0.191 <sup>4</sup> NA <sup>1,5</sup>	0.315 <sup>6</sup>
Fraser Late	Harrison River <sup>2</sup>	0.032 <sup>7</sup>	0.208
North Puget Sound Natural Springs	Nooksack Skagit	NA	0.470
Upper Strait of Georgia	Klinaklini, Kakweikan, Wakeman, Kingcome, Nimpkish	0.079	0.622
Fraser Early (spring and summers)	Upper Fraser, Mid Fraser, Thompson	NA	0.128
West Coast Vancouver Island Falls	WCVI (Artlish, Burman, Kauok, Tahsis, Tashish, Marble)	0.267 <sup>8,10</sup>	0.149 <sup>10</sup>
Puget Sound Natural Summer / Falls	Skagit	NA	0.724
	Stillaguamish	0.074	0.796
	Snohomish	NA	0.721
	Lake Washington	NA	0.722
	Green River	0.109	0.721
North / Central B. C.	Yakoun, Nass, Skeena, Area 8	NA	0.593
Washington Coastal Fall Naturals <sup>3</sup>	Hoko, Grays Harbor, Queets <sup>2</sup> , Hoh <sup>2</sup> , Quillayute <sup>2</sup>	NA	NA
Columbia River Falls <sup>3</sup>	Upriver Brights <sup>2</sup>	NA	NA
	Deschutes	NA	NA
	Lewis <sup>2</sup>	NA	NA
Columbia R Summers <sup>3</sup>	Mid-Columbia Summers <sup>2</sup>	NA	NA
Far North Migrating OR Coastal Falls <sup>3</sup>	Nehalem <sup>2</sup> , Siletz <sup>2</sup> , Siuslaw <sup>2</sup>	NA	NA

<sup>1</sup> Not available (NA) because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc).

<sup>2</sup> Stock or stock group with a CTC agreed escapement goal.

<sup>3</sup> Stock group listed in Annex 4, Chapter 3, Attachment V.

<sup>4</sup> An inconsistency was discovered between the approaches used to calculate the model-based and CWT-based indices. The former included harvest rates for terminal sport while the latter did not. Terminal sport harvest rates are now included in the calculation of both indices. Further review is yet required to determine whether the base period terminal sport harvest rates obtained from analyses of Big Qualicum CWT recoveries adequately represent impacts that would have occurred on Cowichan Chinook.

<sup>5</sup> Several problems have been identified in the approach previously used to calculate the CWT-based indices for Nanaimo Chinook. Until these problems are resolved, indices for this stock will not be reported.

<sup>6</sup> Although model-based indices were previously calculated separately for Cowichan and Nanaimo, these did not adequately represent impacts on either LGS stock because the model-based data represent an aggregate of the two

stocks and methods do not currently exist to correctly disaggregate these data for calculation of the ISBM values. Until such methods are developed, a single index value only will be reported representing the aggregate.

<sup>7</sup> The terminal sport harvest rates for Chilliwack Hatchery Chinook, the indicator stock, were removed from the calculation for the Harrison River naturals because sport harvest has been essentially zero on the natural population.

<sup>8</sup> An inconsistency was discovered between the approaches used to calculate the model-based and CWT-based indices. The former included harvest rates for terminal sport while the latter did not. Terminal sport harvest rates are now included in the calculation of both indices. A more extended review of the indices for WCVI Chinook will be carried out to determine whether they adequately represent impacts on the WCVI wild aggregate.

<sup>9</sup> For Canadian ISBM fisheries, Lake Washington and Green the same distribution and index value are assumed.

<sup>10</sup> ISBM indices for WCVI naturals are based on information from Robertson Cr. hatchery stock, including terminal harvest rates. Prior to this report, harvest rates for terminal net and sport fisheries were treated as equal between the naturals and the hatchery indicator. However, this ignored the fact that since 1999, there has been no terminal net harvest of the vast majority of natural stocks on the WCVI. Consequently, indices for WCVI naturals were adjusted to reflect this zero terminal net harvest rate. In addition, some inconsistencies were noted in the treatment of terminal harvest rates between the model and CWT indices for this stock group. These inconsistencies were eliminated.

Table 3.7. U.S. 2006 ISBM indices based on CWT and the 2008 indices predicted from the PSC Chinook Model. Order of the stock groups correspond to Annex 4, Chapter 3, Attachment V of the PST 1999 Revised Annexes.

Stock Group	Escapement Indicator Stock	U.S. ISBM Indices	
		CWT Indices for 2006	Model Indices for 2008

<sup>1</sup> Not available (NA) because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc).

<sup>2</sup> NC means that the current model assumes the stock is not caught in U.S. ISBM fisheries.

<sup>3</sup> Stock group listed in Annex 4, Chapter 3, Attachment IV.

<sup>4</sup> Stock with a CTC agreed escapement goal.

### 3.6 MODEL CALIBRATION EVALUATION

Previous reports included evaluations of model performance for the most current model year, including comparisons of model estimates of catch and escapement/terminal run sizes to actual estimates of catch and escapement/terminal run size. This year, the model catches and stock escapements or terminal run sizes estimated by CLB 0807 were evaluated as were other aspects of the calibration. The calibration was distributed to the CTC membership for review and subsequently approved. Correlations between model and CWT fishery indices are normally presented. However, while these comparisons were made as part of the normal calibration checking process, the results are not presented in this report.

Fishery mortality indices generated by CLB 0807 can be compared to the CWT-based exploitation rate analysis. Model and CWT-based fishery mortality indices use the same equation, but the former are derived from model estimates of catch for all model stocks instead of CWT recovery data from specific exploitation rate indicator stocks. The CWT fishery mortality indices are considered to be the most accurate. Two types of fishery indices are presented; reported catch and total mortality. In general, the model results are closely associated with the CWT-based indices and changes in fishery exploitation rates as indicated in Figures 3.12 through 3.17. The SEAK fishery mortality index from the model closely follows the trend of the CWT derived estimate from 1979 through 1989 for both landed catch and total mortality (Figures 3.9 and 3.10). Between 1989 and 2000, the model estimate of both landed catch and total mortality indices is less than the CWT-derived estimate for most years but since 2001, the model estimate is noticeably higher. Since 1990, the model estimates also show less variability compared to the CWT-derived indices.

Figure 3.12. Estimated CWT (through 2006) and model landed catch fishery indices (through 2007) for the SEAK troll fishery.

Figure 3.13. Estimated CWT (through 2006) and model total mortality fishery indices (through 2007) for the SEAK troll fishery.

The model-derived fishery mortality indices for NBC generally follow the same trend as CWT-derived indices (Figures 3.14 and 3.15). However, since 1991, the model-based estimates have exceeded the CWT-derived estimates in all but three years for both landed catch and total mortality indices. Since 2001, this difference has been noticeably large.

Figure 3.14. Estimated CWT (through 2006) and model landed catch fishery indices (through 2007) for the NBC troll fishery.

Figure 3.15. Estimated CWT (through 2006) and model total mortality fishery indices (through 2007) for the NBC troll fishery.

Since the base period, the model-derived landed catch fishery index estimates and trends for the WCVI troll fishery have been similar to those derived from CWTs. However, from 1987 through 1995, the model estimates are consistently greater than the CWT-based estimates (Figures 3.16 and 3.17). Starting in 2000, model and CWT estimates have diverged significantly for both landed catch and total mortality, with CWT indices being consistently higher than model indices.

Figure 3.16. Estimated CWT (through 2006) and model landed catch fishery indices (through 2007) for the WCVI troll fishery.

Figure 3.17. Estimated CWT (through 2006) and model total mortality fishery indices (through 2007) for the WCVI troll fishery.

### 3.7 AGENCY STOCK FORECASTS USED IN THE MODEL

A summary of model-produced and agency-produced forecasts from 1999-2008 is shown in Table 3.8. The relationship between the model stocks in Table 3.8 and exploitation rate indicator stocks and PST Annex stocks are shown in Appendix C. A major factor influencing how well the model can predict Chinook abundance in AABM fisheries is how well the model can predict the returns of Chinook (in terms of ocean escapement or spawning escapement) in the forecast year. During model calibration, agency forecasts are input to the model for all model stocks for which model forecasts are available. Thus, for model stocks with external forecasts, the variation between model forecasts and actual returns can be broken into two parts: 1) the ability of the model to match the input agency forecasts, and the ability of the agency forecasts to accurately predict the actual return of Chinook in the upcoming year. In Table 3.8, the column labeled 'Model Fcst/Agency Fcst' shows the percentage deviation of the model prediction from the agency forecast. The column labeled 'Agency Fcst/Postseason' shows the percentage deviation of the the agency forecast from the actual return. The column labeled 'Model Fcst/Postseason' shows the percentage deviation of the model prediction of the return from the actual return.

The model forecasts are similar to the agency forecasts on average. This result is strongly influenced by the incorporation of the agency forecasts into the model calibration procedure. The mean absolute percent error (MAPE) of all 'Model Fcst/Agency Fcst' is 11.7%, and the average percent error is 0%. For all agency forecasts, the MAPE is 32.3% with respect to the postseason estimate, whereas, the average percent error is 1.2%, indicating a small positive bias for the agency forecasts. For model forecasts, the MAPE is 36.8% with respect to the postseason estimate, whereas, the average percent error is 9.5%, indicating a small positive bias for the model forecasts.

The effect of the error in predicting terminal returns or escapement on the AABM abundance indices varies between fisheries and stocks. There is no clear directional bias of this error. For example, a small stock (small in ocean abundance terms) that is over or under predicted will generally not have a large effect on a fishery's abundance index. Errors in predicting a large stock may or not affect a fishery's index, depending on the contribution of that stock to the fishery in question (see Appendix H for the model estimated stock composition of selected ocean fisheries). In addition, since the abundance index is an index, rather than an absolute measure of abundance, over or under prediction of a stock's terminal return or escapement would not affect the abundance index of a fishery if the bias in the prediction is consistent over all years in the index, including the base.

Table 3.8. Preseason forecasts and postseason estimates for PSC model stocks, 1999-2008.

Stock	Year	Model Forecast	Agency Forecast	Postseason Return	Model Fcst/ Agency Fcst	Agency Fcst/ Postseason	Model Fcst/ Postseason

### 3.8 EVALUATION OF MARK-SELECTIVE FISHERIES.

There have been mark-selective fisheries (MSF) for Chinook salmon in the Columbia River net fisheries since 2002, and in Columbia River spring Chinook sport fisheries since 2000. In Puget Sound MSFs have been prosecuted in Areas 5 and 6 during the summer since 2003 and there has been a winter fishery since 2005 in Areas 8.1 and 8.2. Also several freshwater sport fisheries have been mark-selective since 2003 in the Puyallup and Skykomish Rivers, in the Nooksack River since 2004. In 2007 MSFs were extended to summer fisheries in Puget Sound Areas 9, 10, 11 and 13 and winter fisheries in Areas 1, 9 and 10.

Double index tag (DIT) groups were introduced to provide the indicators for natural production (ASFEC 1995) and are comprised of paired releases of marked and unmarked fish with CWTs. The DIT is used as a monitoring tool to test the hypothesis that there are differences between the marked and unmarked tagged groups due to MSFs and also to estimate mortalities of unmarked fish in MSFs. In 2007 eight Puget Sound fall Chinook stocks, one British Columbia River stock and one Columbia River indicator stocks were released as DIT groups (SFEC 2008).

A significant change in the ratio of unmarked to marked DIT groups at hatchery escapement can indicate that mark-selective fisheries have differentially impacted DIT pairs. An analysis comparing the ratio for the broods returning to hatcheries through catch year 2006 indicated little effect of the MSFs between the unmarked and marked DIT pairs. Based on these results, the estimates of exploitation rate of marked tagged groups were used in CTC analyses this year without adjustment for MSFs.

Troll, net, sport and total catches include catch of SEAK hatchery-origin fish; catches that count towards the all-gear ceiling (with hatchery add-on subtracted) are shown in the "treaty catch" column.

"-" = not applicable.

<sup>1</sup> The value on top excludes District 108 Stikine catch above base levels. The value below includes it.

<sup>1</sup> Since 1998, the catch accounting year for troll fisheries was set from October 1-September 30. To make comparisons to previous years more meaningful, the same catch accounting period was applied for years prior to 1998.

<sup>2</sup> Estimate of lower Skeena River sport catch only.

Note that Troll (Areas 1-5) and Tidal Sport (Areas 1, 2E, 2W) are the components of the NBC AABM fishery. Net catch excludes jacks and small red-fleshed Chinook.

2007	28,170	56,875	40,142	125,187

<sup>1</sup> The historical time series of catches in this year's report has changed from last year's report. Catches after 1980 have been broken out into non-Treaty net and Treaty Indian due to the inability to separate commercial vs. non-commercial. Catches from 1975-1980 are consistent for sport and total with the later times series.

Appendix A.14. Oregon Chinook catches, 1975-2007.

<sup>1</sup> GW refers to Gitwinkuhlkw, the location of the lower fish wheels on the Nass River used to capture Chinook for the mark-recapture estimate

<sup>2</sup> The Doce River was dropped as an escapement indicator due to an inability to obtain reliable escapement estimates

Goal			17,857						5,700					40,000		

1/ Columbia Upriver Summers are a single escapement indicator stock with an agency management goal of 85,000. Mid-Columbia summers and Snake River summers exhibit different life history types. Only Mid-Columbia is included in the model stock. Based on a S-R analysis of model data, the interim goal for Mid-Columbia Summers is 17,857 until better data can be compiled.

2/ This is the number of naturally spawning adult fish in the Lewis River. The terminal run given is the escapement plus the Lewis River sport catch of wild adults.

3/ The first column is based on a mark-recapture project for the entire river. The second column is based on using the ratio of redds above and below Shinarump Falls. The agencies' management goal is 4000.

4/ The CRFMP stated an interim escapement goal of 40,000 natural spawning URBs at McNary Dam, including 38,700 for Hanford Reach and 1,100 Snake River. In 1990, the escapement goal was increased to 45,000 for increased hatchery programs. In 1994, a management goal of 46,000 was established, and in 1995, the management goal was retained while the escapement goal was reduced to 43,500. In 2002, the CRFMP escapement goal of 40,000 was agreed to by the CTC. Escapement numbers given are McNary adult dam count minus adult sport and broodstock above the dam. The terminal run is the Columbia River mouth terminal run of Upriver Brights minus the Deschutes River fall Chinook terminal run.

Appendix B.6. Oregon Coastal escapements as estimated via traditional habitat expansion methods and terminal runs of PSC Chinook Technical Committee wild Chinook salmon escapement indicator stocks, 1975-2007.

<sup>1</sup> The CWT-based estimates, not the model estimates, are to be used in postseason assessments

<sup>2</sup> NA means not available because of insufficient data (lack of stock specific tag codes, base period CWT recoveries, etc)

<sup>3</sup> Stock or stock group with an agreed CTC escapement goal

<sup>4</sup> Stock group not in Annex Attachment IV

<sup>5</sup> Indices for this stock are calculated from CWT recoveries for Cowichan, differences between Nanaimo and Cowichan stock indices are due to differences in terminal harvest

<sup>6</sup> An inconsistency was discovered between the approaches used to calculate the model-based and CWT-based indices. The former included harvest rates for terminal sport while the latter did not. Terminal sport harvest rates are now included in the calculation of both indices. Further review is yet required to determine whether the base period terminal sport harvest rates obtained from analyses of Big Qualicum CWT recoveries adequately represent impacts that would have occurred on Cowichan Chinook.

<sup>7</sup> Several problems have been identified in the approach previously used to calculate the CWT-based indices for Nanaimo Chinook, indices for this stock will not be reported as their utility is questionable.

<sup>8</sup> Although model-based indices were previously calculated separately for Cowichan and Nanaimo Chinook, these did not adequately represent impacts on either LOS stock. This is because the model-based data represent an aggregate of the two stocks and methods do not currently exist to correctly disaggregate these data for calculation of the ISBM values. Until such methods are developed, a single index value only will be reported representing the aggregate.

<sup>9</sup> The terminal sport harvest rates for Chilliwack Hatchery Chinook, the indicator stock, were removed from the calculation for the Harrison River naturals this year because sport harvest has been essentially zero on the natural population.

<sup>10</sup> A review of the approach used to calculate both the CWT-based and model data-based indices for the WCVI naturals was carried out in 2008. A similar approach was adopted for both indices but due to modifications to the formerly used procedures, the historical time series of values was updated.

<sup>11</sup> For the Canadian ISBM fisheries, both Lake Washington and Green are assumed to have the same distribution and thus the same index value.

<sup>12</sup> ISBM indices for WCVI naturals are based on information from Robertson Cr. hatchery stock, including terminal harvest rates. Prior to this report, harvest rates for terminal net and sport fisheries were treated as equal between the naturals and the hatchery indicator. However, this ignored the fact that since 1999, there has been no terminal net harvest of the vast majority of natural stocks on the WCVI. Consequently, indices for WCVI naturals were adjusted to reflect this zero terminal net harvest rate. In addition, some inconsistencies were noted in the treatment of terminal harvest rates between the model and CWT indices for this stock group. These inconsistencies were eliminated.

## Appendix E. Percent distribution of landed catch and total mortality among fisheries and escapement for exploitation rate indicator stocks by calendar year.

These data result from cohort analysis of CWT recoveries for the indicator stocks; data within a row for each calendar year sum to 100%. Some changes are present in these distribution tables compared to those presented in previous reports. There are various reasons for the changes including updates to escapement time series, in the case of some Columbia River stocks. Also, a computational rule used in producing the stock-specific distribution tables determines whether data are reported for any particular calendar year. The rule is that at least three year classes of CWT recoveries (out of four or five) must be available in any calendar year. Lack of CWT releases in recent years for some of the indicators has resulted in no distribution data for 2000-2003. Missing broods are noted in the appropriated tables.

<sup>1</sup> Ocean exploitation rates based only on ocean fisheries are shown for stocks in which terminal fisheries differentially impact the coded-wire tagged indicator compared to the associated wild stock. Total exploitation rates based on ocean plus terminal fisheries are shown for stocks in which fishery impacts on the indicator and the associated wild stock are similar in terminal areas. Exploitation rates are not shown for the following hatchery stocks because they are not associated with a wild stock: University of Washington Accelerated, South Puget Sound Fall Yearling, Squaxin Pens Fall Yearling. Exploitation rates cannot be calculated for the following stocks without sufficient escapement data: Nisqually Fall Fingerling, White River Spring Yearling, Elwha Fall Fingerling.

<sup>2</sup> The corresponding stocks used in the Chinook model calibration are indicated in brackets.

Figure G.32. Elk River ocean exploitation rates by brood year.

## Appendix H. Model estimates of the stock composition of the AABM, and other troll and sport fisheries for 2007 and the average from 1985 to 2006.

"Catch as Percent of Fishery" represents the stock composition of a specific fishery; "Catch as Percent of All Fisheries" represents the proportion of the total catch of a stock that is caught in a specific fishery; "Percent of Total Return" represents the proportion of total return (catch + escapement) caught in a specific fishery.

**Appendix K. Abundance indices in total and by model stock for AABM fisheries, from Calibration #0807.**

**LIST OF APPENDIX K TABLES**

	<u>Page</u>
Table K.1. Abundance indices (AIs) for the Southeast Alaska troll fishery by model stock and year (stock groups 1-15), from CLB 0807. Numbers represent the model stock contribution to the total AI: the summation across all 30 stocks and stock groups equals the AI total for each calendar year.....	259
Table K.2. Abundance indices (AIs) for the Northern BC troll fishery by stock and year (stock groups 1-15), from CLB 0807. Numbers represent the model stock contribution to the total AI: the summation across all 30 stocks and stock groups equals the AI total for each calendar year. ....	261
Table K.3. Abundance indices (AIs) for the WCVI troll fishery by stock and year (stock groups 1-15), from CLB 0807. Numbers represent the portion of the AI total estimated for each model stock; the summation across all 30 stock groups equals the AI total for each. ....	263

Table K.1. Abundance indices (AIs) for the Southeast Alaska troll fishery by model stock and year (stock groups 1-15), from CLB 0807. Numbers represent the model stock contribution to the total AI: the summation across all 30 stocks and stock groups equals the AI total for each calendar year.

Table K.3. Abundance indices (AIs) for the WCVI troll fishery by stock and year (stock groups 1-15), from CLB 0807. Numbers represent the portion of the AI total estimated for each model stock; the summation across all 30 stock groups equals the AI total for each.

**Appendix L. Fishery exploitation rate indices by stock, age and fishery, based on CWT data, 1975–2006.**

**LIST OF APPENDIX L TABLES**

	<b><u>PAGE</u></b>
Table L.1. Alaska troll Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data.....	266
Table L.2. Alaska troll Stratified Proportion Fishery Index (SPFI) values as total mortality, based on CWT data.....	267
Table L.3. Landed catch exploitation rate indices by stock and age in the NBC troll fishery, based on CWT data. Base period is 1979-1982.....	268
Table L.4. Total mortality exploitation rate indices by stock and age in the NBC troll fishery, based on CWT data. Base period is 1979-1982.....	269
Table L.5. Landed catch exploitation rate indices by stock and age in the WCVI troll fishery, based on CWT data. Base period is 1979-1982.....	270
Table L.6. Total mortality exploitation rate indices by stock and age in the WCVI troll fishery, based on CWT data. Base period is 1979-1982.....	271

Table L.1. Alaska troll Stratified Proportion Fishery Index (SPFI) values as landed catch, based on CWT data.
